

Enterprise Release Blocker Resolution Planning Prompt

A dependency-ordered, evidence-driven prompt for engineering, security, operations, compliance, and release management

PURPOSE

Use this prompt to produce a complete and assignable plan for removing every current enterprise-release blocker without weakening safety controls or interrupting unrelated feature development.

REFINED EXECUTION PROMPT

Act as a multidisciplinary principal review and delivery team comprising a software architect, DevOps/SRE engineer, security engineer, database engineer, payroll specialist, compliance lead, release manager, and technical program manager.

Study the current enterprise-release blockers using these authoritative reports:

what-next/AQSTOQFLOW_017_ENTERPRISE_RELEASE_GATE_EXECUTION_REPORT_2026-07-27.md

what-next/skill-017-country-pack-production-readiness.json

what-next/skill-017-release-secret-preflight.json

what-next/skill-017-prisma-migration-release-readiness.json

- Also inspect the relevant agent-runtime operational, credential-rotation, freeze, Phase 2B, and Phase 3 evidence.

Develop the cleanest, safest, least disruptive, and most practical plan for removing every blocker while allowing normal project development and feature integration to continue.

Required blocker coverage

1. The Next.js production-build failure caused by non-async exports in actions/hris/operational-time.actions.ts.
2. The payroll immutability test-database migration failure and all nine missing runtime trigger checks.
3. Country-pack production blockers: source_artifact_hash_verification and source_artifact_expert_approval.
4. Production secret provisioning: PUBLIC_IDENTITY_ABUSE_HASH_SECRET, AQSTOQFLOW_RECEIPT_TOKEN_SECRET, and AQSTOQFLOW_HISTORY_CURSOR_SECRET.
5. The missing safe production PostgreSQL target and deployment attestation.
6. The invalidated release freeze, dirty working tree, manifest mismatch, and runtime drift.
7. The 31 credential-rotation blockers across 15 credential classes.
8. The 152 operational-release evidence blockers.
9. The Phase 2B and Phase 3 promotion blockers.
10. Final immutable release evidence, independent review, and production approval.

Required workstream separation

- **Engineering lane:** Repository changes that can be completed immediately.

- **Platform and operations lane:** Secrets, databases, CI/CD, scheduler, reconciler, monitoring, credential rotation, and deployment evidence.
- **Regulatory lane:** Source hashes, expert review, signatures, and country-pack production certification.

The regulatory lane must not block unrelated software development. Unverified country packs and authority adapters must remain sandbox-only and fail closed in production until authentic evidence is available.

Required analysis for every blocker

- Root cause
- Risk and affected capability
- Dependencies
- Exact remediation steps
- Responsible role
- Required repository or external artifacts
- Verification commands
- Expected passing result
- Completion evidence
- Rollback procedure
- Whether it blocks development, staging, production, or agent activation

Dependency-ordered execution phases

1. Immediate repository stabilization
2. Test and database restoration
3. Platform and secret provisioning
4. Regulatory evidence completion
5. Operational readiness and credential rotation
6. Clean release-candidate freeze
7. Independent review and final release-gate rerun

Include a critical-path plan, parallelizable workstreams, milestone exit criteria, and a blocker register showing status, owner, prerequisites, target evidence, and next action.

Non-negotiable safeguards

- Do not disable, weaken, bypass, mock, or relabel a failing production gate.
- Do not insert placeholder hashes, signatures, credentials, approvals, or deployment evidence.
- Do not expose secret values in logs or reports.
- Do not claim regulatory, operational, or production readiness from static tests alone.
- Do not apply migrations to an unidentified or unsafe database.
- Do not activate Phase 2B, Phase 3, production automation, or agent authority prematurely.

Required conclusion

- The recommended execution order
- Immediate actions for the next 24 hours
- Actions for the next seven days
- External or human-dependent work
- Commands required for the final verification
- The evidence required for Skill 017 to return APPROVED
- A clear distinction between development readiness, staging readiness, and production readiness

Produce the plan as an enterprise-grade execution document that can be assigned directly to engineering, security, operations, compliance, and release-management teams.
