

Cameroon CNPS External Review and Signature Enablement Prompt

Act as a multidisciplinary principal review team: system architect, cyber-security architect, senior frontend engineer, UI/UX specialist, product strategist, business logic analyst, and SaaS growth advisor.

Act as a senior enterprise payroll, regulatory-assurance, and country-pack architecture team, including:

- a Cameroon labour and social-security regulatory specialist;
- an independent payroll compliance reviewer;
- a cryptographic evidence and digital-signature specialist;
- a maker–checker controls specialist;
- a release-assurance engineer;
- an OHADA/SYSCOHADA-aware platform architect.

Objective

Determine and implement the cleanest, legally credible, auditable process for obtaining the external reviews, signatures, and technical evidence required to clear these Cameroon country-pack production blockers:

- `source_artifact_hash_verification`
- `source_artifact_expert_approval`

Official CNPS publications verify the regulatory source, but they do not automatically constitute signed regulator approval of Stoquify's interpretation or implementation. They also do not satisfy the repository's independent-reviewer, fixture-tie-out, conflict-declaration, signature, and maker–checker contracts.

Build the complete approval package and operational workflow needed to obtain legitimate signatures without fabricating identities, approvals, qualifications, regulator correspondence, review results, or production authorization.

Evidence to inspect

Inspect the following first:

- `docs/country-pack/CAMEROON_CNPS_AUTHORITATIVE_EVIDENCE_RESEARCH_REPORT_2026-07-26.pdf`
- `docs/country-pack/CAMEROON_COUNTRY_PACK_EVIDENCE_AND_APPROVAL_READINESS_REPORT_2026-07-26.pdf`
- `docs/HR-Payroll/evidence/country-packs/CM/2026-07-19/`
- `docs/HR-Payroll/evidence/country-packs/CM/2026-07-19/manifest.json`
- `docs/HR-Payroll/evidence/country-packs/CM/2026-07-19/authoritative-source-supplement-2026-07-26.json`
- the existing review-decision template and JSON schema;
- `services/regulatory/country-packs/cameroon.ts`;
- the qualified-review preflight script;
- the statutory country-pack production-gate script;
- the enterprise release-gate requirements;
- relevant country-pack tests and evidence-validation scripts.

Use `graphify-out/` where necessary to understand dependencies between the country-pack manifest, fixture hashes, review decision, production gate, and enterprise release gate.

Required analysis

1. Separate the approval types

Define precisely what each status means and who may legitimately grant it:

1. SOURCE_VERIFIED

- proves that the retained source is authentic and its digest is correct;
- may be completed through independent hash verification and provenance checks.

2. EXPERT_REVIEWED

- requires an independent, appropriately qualified Cameroon payroll, labour-law, social-security, accounting, or legal professional;
- must include interpretation review, fixture coverage, independent calculations, conflict declaration, dates, decision, and signature.

3. REGULATOR_CONFIRMED

- requires explicit written confirmation from CNPS or another competent Cameroon authority if the label means regulator approval of the interpretation or implementation;
- must not be inferred merely because documents were downloaded from the CNPS website.

Determine whether production actually requires regulator confirmation or only independent expert approval. Do not create an unnecessary regulator-approval requirement if the repository contract does not require it.

2. Identify acceptable reviewers

Specify the qualifications and independence criteria for:

- the source-artifact hash verifier;
- the regulatory or payroll expert reviewer;
- the authorized maker-checker approver;
- the person permitted to authorize production use.

Explain whether these roles must be held by different people.

Define acceptable evidence of qualification, such as:

- professional registration or licence;
- employer or firm affiliation;
- relevant Cameroon payroll/CNPS experience;
- legal, accounting, tax, actuarial, or social-security expertise;
- engagement letter or scope of work;
- identity and contact verification;
- conflict-of-interest declaration.

Do not include unnecessary personal data in repository artifacts. Define a suitable redaction policy.

3. Produce a reviewer-ready evidence packet

Assemble a professional review packet covering all four fixture families:

- payroll.cnps.pensionRatesBps
- payroll.cnps.familyAllowanceRatesBps
- payroll.cnps.occupationalRiskRatesBps

- payroll.cnps.employerRules

For every fixture family, include:

- implemented value;
- legal reference and exact source provision;
- official source URL;
- retained artifact filename;
- retained artifact SHA-256;
- effective date and proposed 2026 applicability;
- interpretation made by the implementation;
- independent calculation scenarios;
- expected outputs;
- ceilings and boundaries;
- rounding rules;
- category mappings;
- exceptions and uncertainties;
- reviewer decision field;
- reviewer comments field;
- independent tie-out hash field.

Make the packet understandable to a qualified professional who does not know the codebase.

4. Define independent hash verification

Create a reproducible procedure requiring the verifier to:

1. obtain or inspect the retained official artifacts;
2. recompute SHA-256 independently;
3. compare the results with the evidence manifest;
4. record the tool and command used;
5. record the verification date;
6. sign the verification statement;
7. produce a hash-verification artifact whose own digest can be recorded.

Determine exactly which hash must replace every symbolic `sourceEvidenceHash` in the implementation. Do not replace hashes until the approval preflight passes.

5. Define the expert-review procedure

Create a formal review checklist requiring the expert to confirm or reject:

- authenticity and authority of each source;
- whether Decree No. 2016/072 remains effective for the proposed 2026 period;
- amendments, replacements, exceptions, or transitional provisions;
- every implemented rate and ceiling;
- employer and employee allocation;
- occupational-risk category interpretation;

- employer calculation, withholding, declaration, and payment obligations;
- fixture calculations and rounding;
- all four independent tie-out hashes;
- suitability for production use during the stated effective period.

Require explicit outcomes such as:

- APPROVED
- APPROVED_WITH_LIMITATIONS
- REJECTED
- MORE_EVIDENCE_REQUIRED

Only a decision compatible with the repository gate may authorize production.

6. Define the signature contract

Determine which signature methods the repository accepts or should accept, such as:

- qualified or advanced electronic signature;
- organization-issued digital certificate;
- signed PDF with verifiable certificate metadata;
- detached CMS/PKCS#7 signature;
- PGP signature from an independently verified reviewer key;
- handwritten signature followed by controlled identity verification, if permitted by policy.

The signed artifact must preserve:

- reviewer identity and organization;
- qualification;
- conflict declaration;
- review period;
- effective period approved;
- complete fixture coverage;
- final decision;
- production-use authorization;
- signature method;
- signing timestamp;
- certificate or key identifier where applicable;
- signed file SHA-256;
- verification result.

Do not treat a typed name, checkbox, repository commit, or internally generated signature as sufficient unless the existing contract explicitly permits it.

7. Prepare regulator correspondence if necessary

If explicit regulator confirmation is genuinely required, prepare—but do not send without authorization—a professional request addressed to CNPS containing:

- the relevant regulatory provisions;

- the proposed interpretation;
- all contribution rates and ceilings;
- four fixture-family summaries;
- proposed effective period;
- specific questions requiring confirmation;
- a request for an official reference number, named signatory, title, date, signature, and confirmation of production use.

Clearly distinguish:

- confirmation of the applicable law;
- confirmation of the interpretation;
- approval of fixture calculations;
- authorization or non-objection concerning software production use.

Do not claim that CNPS normally certifies private software unless authoritative evidence demonstrates that it does.

Required artifacts

Create or complete, using existing repository schemas where available:

1. a reviewer-ready evidence index;
2. a four-family fixture review workbook or structured document;
3. an independent hash-verification form;
4. an expert-review checklist;
5. a reviewer qualification and conflict-declaration form;
6. a maker–checker approval form;
7. a signature-verification procedure;
8. a draft regulator-confirmation request, only if required;
9. a field-level mapping showing how signed evidence populates:
 - the review decision;
 - the primary evidence manifest;
 - production authorization;
 - implementation source hashes;
10. an exact post-signature execution runbook.

Save the package under:

`docs/HR-Payroll/evidence/country-packs/CM/2026-07-19/review-package/`

Save the implementation and readiness report under:

`docs/country-pack/`

Controlled implementation

Implement repository-side improvements only where they make the legitimate review process easier and do not weaken controls.

Permitted improvements include:

- clearer validation messages;
- deterministic hash-verification commands;
- schema-valid templates;
- signature-verification tooling;
- reviewer packet generation;
- field-completeness checks;
- evidence-chain validation;
- safe preflight diagnostics.

Do not:

- invent or autofill reviewer identity;
- generate a fake signature;
- mark review as approved;
- set `productionUseAllowed: true`;
- replace symbolic hashes prematurely;
- redefine `REGULATOR_CONFIRMED` silently;
- remove maker-checker separation;
- bypass either production blocker;
- modify unrelated code or lint findings.

Preserve existing worktree changes.

Verification

Run and record:

```
node scripts/statutory-country-pack-review-preflight.js --mode report
node scripts/statutory-country-pack-production-gate.js --mode report
npm run statutory:country-pack:dev:gate
```
