Trial Balance UI Refinement Report

Trial Balance presentation, pagination, accessibility, and verification

Generated 2026-08-02

Internal project documentation

Date: 2026-08-01

Route: `/[[locale]]/dashboard/accounting/reports/trial-balance`

Workspace: `E:\ohada saas\Focused projects\stoquify`

Refined Professional Prompt

Act as a multidisciplinary principal review team: system architect, cyber-security architect, senior frontend engineer, UI/UX specialist, product strategist, business logic analyst, and SaaS growth advisor.

Project:

Stoquify / AqStoqFlow platform.

Workspace:

``E:\ohada saas\Focused projects\stoquify``

Domain:

Accounting reporting – Trial Balance.

Mission:

Redesign the Trial Balance page so a large chart of accounts no longer creates an unbounded page. Deliver a professional, modern, responsive accounting workbench with client-side pagination, compact row presentation, search, focused filters, sticky table context, and clearly labelled full-report totals. Preserve the canonical tenant-scoped server report, accounting permissions, account order, debit/credit semantics, balance status, error behavior, and zero-balance inclusion.

Domain lens:

Act as a senior enterprise accounting-reporting architecture team:

- Preserve the existing server action and accounting read-model ownership.
- Keep canonical monetary values, totals, and ``isBalanced`` server-owned.
- Preserve tenant isolation, ``accounting.reports.read``, safe action errors, and the existing module boundary.
- Keep debit and credit values separate, right-aligned, and unambiguous.
- Keep full-report totals visible on every page; never present page subtotals as report totals.
- Retain all financial columns on narrow screens through a labelled horizontal scroll region rather than hiding accounting information.

Tasks:

1. Inspect the route, focused tests, accounting UI helpers, report action/service, relevant graph output, and dirty-worktree overlap.
2. Preserve ``checkPermission("accounting.reports.read")`` before data access and preserve ``getTrialBalanceAction({ includeZeroBalance: true })``.
3. Move interactive presentation into a route-local client component without changing the action, service, schema, or database.
4. Add 10/25/50 row pagination, account search, account-type filtering, and a posted-activity

filter; reset to page one when controls change.

5. Add a bounded, focusable table region with sticky headers, a sticky Account column, tabular monetary values, accessible headers/caption, intentional empty states, and responsive controls.

6. Display the server-provided full-report totals on every page and state the total account scope explicitly.

7. Correct report copy to disclose both posted and reversed journal entries and label debit/credit balances explicitly.

8. Add focused interaction tests, run TypeScript and scoped lint checks, and capture authenticated desktop/tablet/mobile evidence.

9. Save verification results and unresolved limitations under ``what-next/accounting/``.

Success criteria:

- A report with more than ten rows renders only the selected page and has working Previous/Next controls.
- Search and filters update the visible result count and reset pagination safely.
- Full canonical totals stay unchanged and visible across pages and filters.
- Permission ordering, tenant-scoped action behavior, error handling, zero-balance inclusion, and account-code order remain unchanged.
- The table exposes a caption, scoped headers, a keyboard-focusable labelled scroll region, and non-wrapping tabular money columns.
- The route renders successfully at 390px, 1024px, and 1440px widths.
- Focused Jest, scoped ESLint, and project TypeScript checks pass.

Execution Checklist

- ☒ Inspected the route, action, service, focused tests, shared accounting UI, graph output, and related table patterns.
- ☒ Confirmed the canonical service is tenant scoped and ordered by account code.
- ☒ Confirmed totals and `isBalanced` are server-owned.
- ☒ Preserved the page permission guard and exact action input.
- ☒ Added route-local client pagination and filtering.
- ☒ Added accessible bounded table presentation and responsive controls.
- ☒ Added focused interaction coverage.
- ☒ Ran focused Jest, scoped ESLint, and project TypeScript verification.
- ☒ Captured authenticated mobile, tablet, and desktop screenshots.

Evidence Inspected

- `app/[locale]/(dashboard)/dashboard/accounting/reports/trial-balance/page.tsx`
- `app/[locale]/(dashboard)/dashboard/accounting/reports/trial-balance/__tests__/page.test.tsx`
- `app/[locale]/(dashboard)/dashboard/accounting/_components/accounting-ui.tsx`
- `actions/accounting/reports.actions.ts`

- `services/accounting/reports.service.ts`
- `components/ui/table.tsx`
- `graphify-out/graph.json`
- Per-directory app/actions/services graph outputs identified during architecture review.

Graph evidence placed the route, shared accounting UI, protected action, and reporting service in separate communities. That supports a route-local interactive table while leaving action and service ownership unchanged.

Implemented Artifacts

- Updated `app/[locale]/(dashboard)/dashboard/accounting/reports/trial-balance/page.tsx`.
- Added `app/[locale]/(dashboard)/dashboard/accounting/reports/trial-balance/trial-balance-table.tsx`.
- Added `app/[locale]/(dashboard)/dashboard/accounting/reports/trial-balance/__tests__/trial-balance-table.test.tsx`.
- Added browser evidence:
 - `mobile.png` — 390 × 844 viewport.
 - `tablet.png` — 1024 × 900 viewport.
 - `desktop.png` — 1440 × 1000 viewport.

Verification Results

Check	Result
Focused route + table Jest suites	PASS — 2 suites, 5 tests
Scoped ESLint on the three changed source/test files	PASS
<code>npm run typecheck</code>	PASS
Authenticated route smoke at <code>/en/dashboard/accounting/reports/trial-balance</code>	PASS
Trial Balance heading	PASS — one rendered
Table	PASS — one rendered
Labelled pagination navigation	PASS — one rendered
Keyboard-focusable labelled table region	PASS — one rendered
Mobile/tablet/desktop screenshot review	PASS — controls stack or wrap, table remains horizontally reachable, totals remain present

The authenticated browser dataset contained no trial-balance accounts, so screenshots validate the live shell, controls, empty state, totals, responsive behavior, and accessibility structure. The 12-row Jest fixture validates populated pagination and filter behavior.

Risk Controls

- Tenant isolation: unchanged; the protected action still supplies `ctx.orgId` to the service.
- RBAC: unchanged; the page guard and protected action both require `accounting.reports.read`.
- Accounting truth: unchanged; rows, totals, and `isBalanced` still come from the canonical service.
- Report scope: every footer is labelled `Report totals` and `All N accounts`, preventing confusion with page subtotals.
- Debit/credit clarity: financial columns remain separate and the balance summary now labels both sides.
- Dirty worktree: only the route-local page, new component/test, and this evidence folder were touched.
- Data integrity: no schema, migration, seed, action, service, export, or database changes were made.

Non-Goals

- No server-side query pagination or database changes.
- No period/date filter workflow.
- No export-control changes.
- No sortable columns or accounting-order changes.
- No edits to shared table/UI primitives.
- No unrelated lint cleanup or broad accounting refactor.

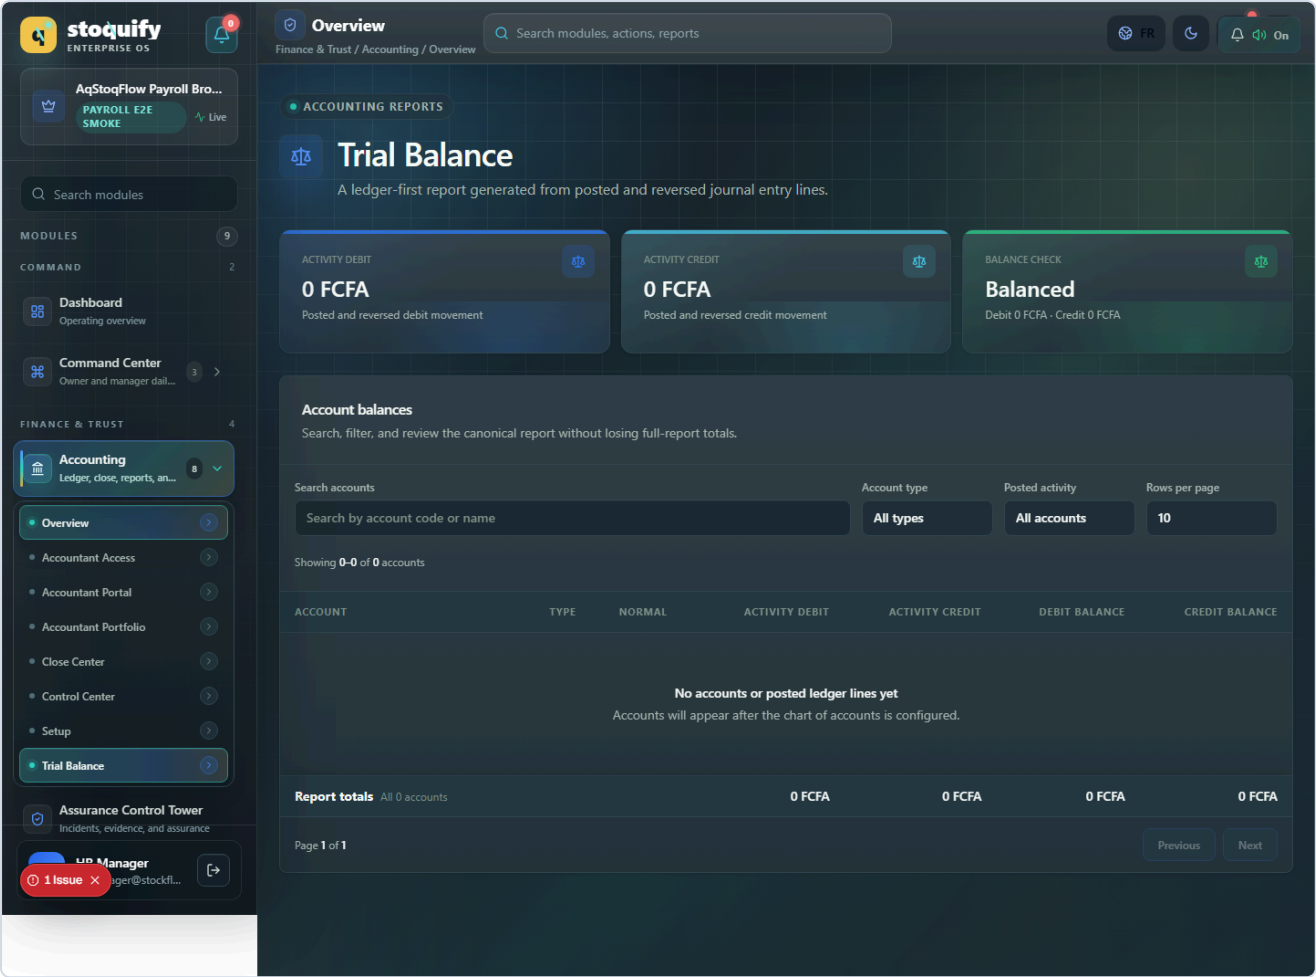

Known Limitation

Pagination is intentionally presentation-side: the canonical report is still loaded once and the browser slices the returned chart-of-account rows. This resolves the unbounded page and is appropriate for normal charts of accounts. If tenants later reach thousands of accounts or payload/query measurements show a real bottleneck, server-owned pagination should be designed as a separate reporting-service change with stable global totals and export semantics.

Browser Evidence

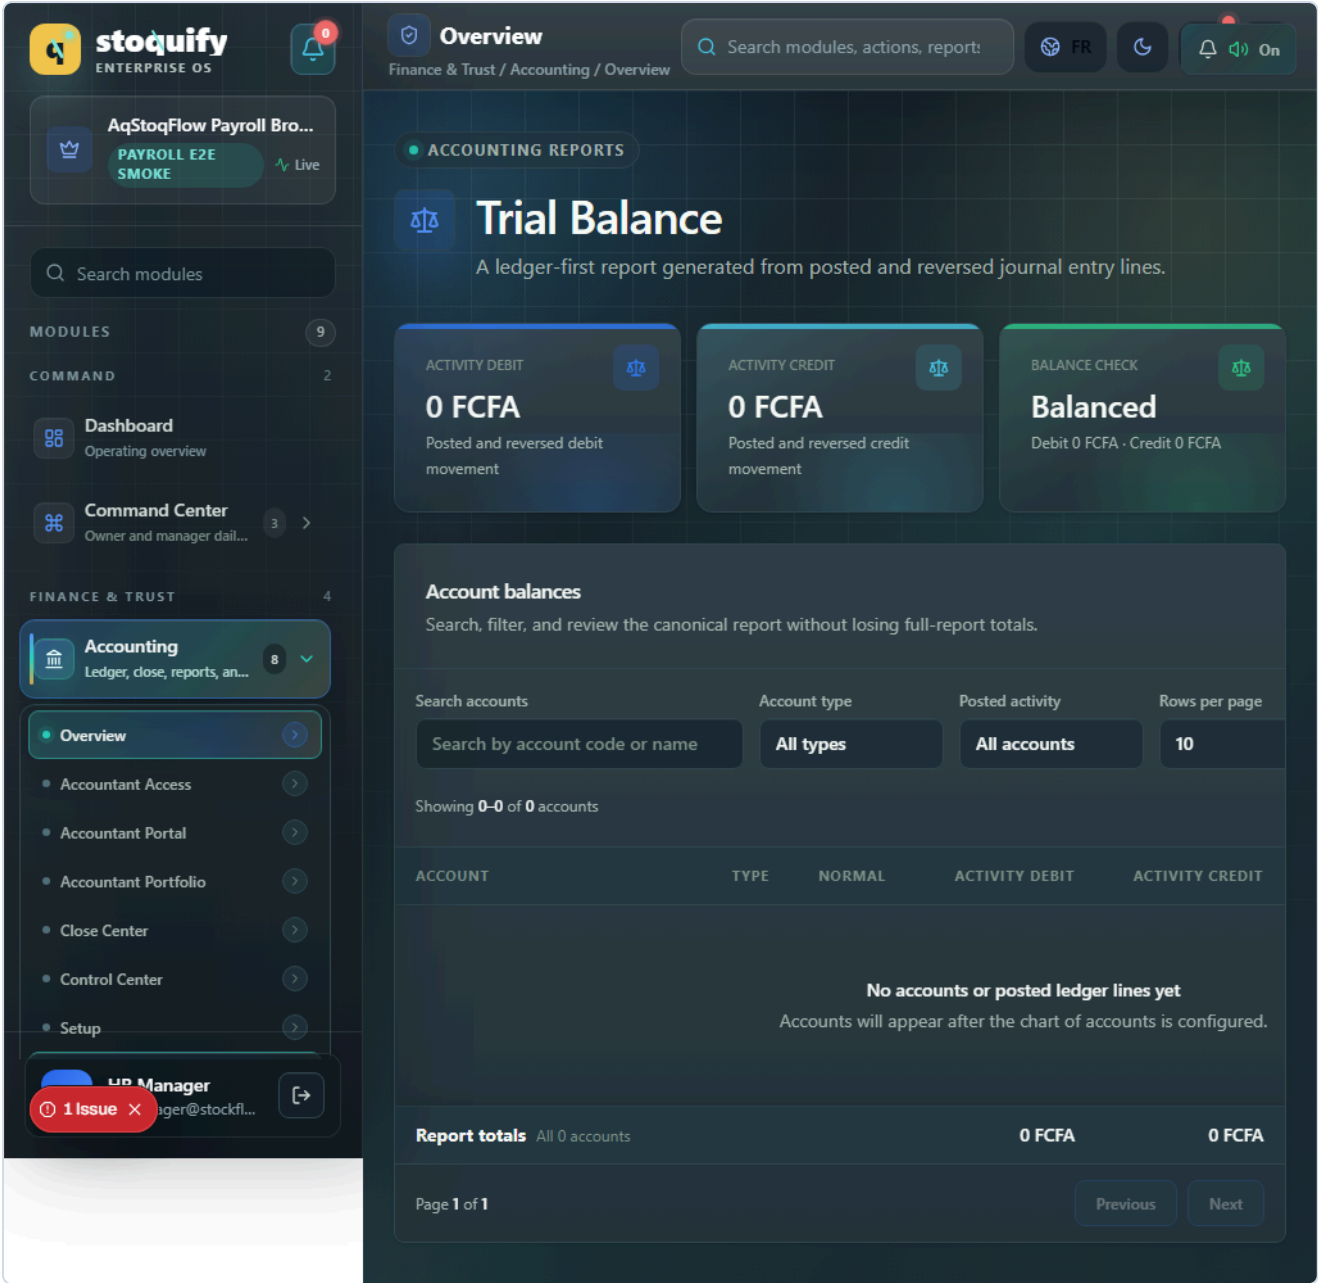

Authenticated responsive captures retained with source implementation evidence.

Desktop evidence

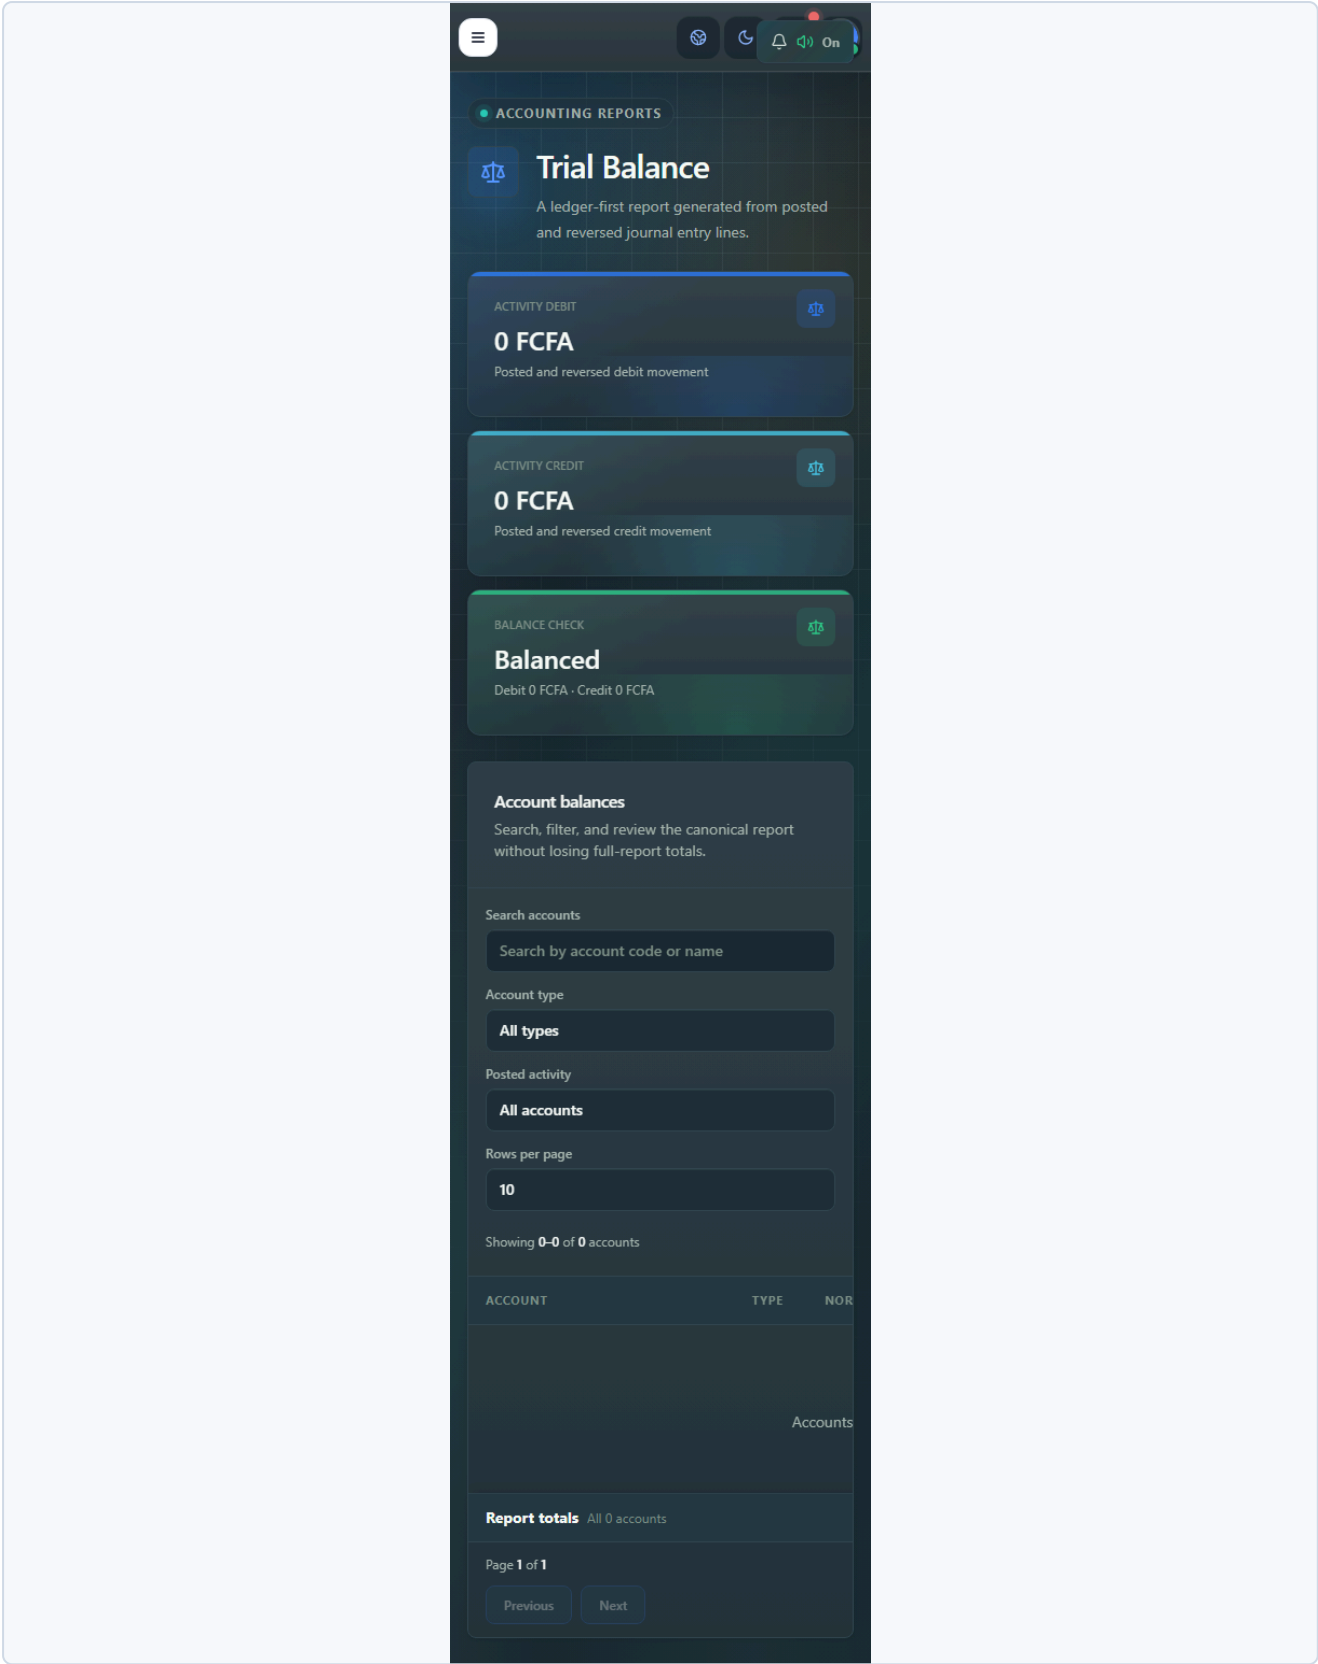

what-next/accounting/trial-balance-ui-2026-08-01/desktop.png

Tablet evidence

what-next/accounting/trial-balance-ui-2026-08-01/tablet.png

Mobile evidence
