

Stoquify Agent Runtime Release Evidence Classification Hardening Execution Report

Date: 2026-07-25

Scope: Global release evidence synthesis supporting Agent Runtime skill 017

Repository implementation: Complete and verified

Release status: Blocked

Activation authorized: No

Executive Result

The global release-evidence ratchet no longer confuses valid fail-closed readiness evidence with malformed or ambiguous JSON.

Before this correction, any readiness artifact with **status: blocked** caused the structural check **readiness_json_is_parseable_and_clear** to fail. That obscured the difference between:

- a corrupt or contradictory evidence file; and
- a valid authority gate that deliberately reports unresolved release blockers.

The corrected ratchet validates structural clarity independently, then preserves every clear non-ready artifact as a hard release blocker. No blocked artifact is promoted to ready.

Structural Contract

A readiness summary is structurally clear only when:

1. **status** is **ready**, **blocked**, or **conditional**;
2. **checkCount** is a positive integer;
3. **readyCount** is an integer between zero and **checkCount**;
4. **blockerCount** is a non-negative integer;
5. **warningCount**, when present, is a non-negative integer;
6. **ready** means every check is ready and blocker count is zero;
7. **blocked** or **conditional** means at least one check is not ready and blocker count is nonzero.

Malformed JSON, missing summaries, unknown statuses, impossible counts, and contradictory status/count combinations remain structural failures.

Release Contract

After structural validation:

- clear **ready** artifacts contribute no blocker;
- clear **blocked** or **conditional** artifacts become **readiness:<artifact-id>** release blockers;
- missing or ambiguous artifacts remain structural blockers;
- release mode reports **blocked** whenever either structural or release blockers exist;
- non-release mode reports **conditional**, never falsely **ready**, when unresolved release conditions exist.

The index also now includes the previously omitted `AQSTOQFLOW_HISTORY_CURSOR_SECRET` condition as `history_cursor_signing_secret`.

Current Release Evidence Result

Structural checks ready: 11/11

Structural blockers: 0

Release blockers: 6

Readiness release blockers: 2

Environment release blockers: 4

Status: blocked

Readiness blockers:

- `readiness:statutory-country-pack-production;`
- `readiness:prisma-migration-deployment.`

Environment blockers:

- `public_identity_hash_secret;`
- `public_receipt_token_secret;`
- `history_cursor_signing_secret;`
- `production_database_target.`

The generated index now directs operators to remain on `017-aqstoqflow-enterprise-release-gate`.

Files

- `scripts/release-evidence-ratchet.js`
- `scripts/__tests__/release-evidence-ratchet.test.js`
- `what-next/skills-life-cycle/STOQUIFY_OHADA_LEADERSHIP_RELEASE_EVIDENCE_INDEX_2026-07-11.md`
- `what-next/skills-life-cycle/stoquify-ohada-leadership-release-evidence-index-2026-07-11.json`

Verification

Check	Result
Focused release-evidence tests	5/5 passed
Complete release and operational evidence suite	9 suites, 88 tests passed
Focused open-handle detection	Passed
Full Jest	474 suites and 2,863 tests passed; 3 suites and 15 tests skipped
Focused ESLint	Passed
TypeScript	Passed
CI configuration readiness	11/11 passed

Check	Result
Phase 2A static gate	Passed
Agent runtime authority gates	Passed
Credential rotation gate	Blocked: 15 classes, 31 blockers
Operational release gate	Blocked: 152 blockers; activation false
Statutory country-pack gate	Blocked: 10/12
Production database preflight	Blocked: 7/8
Production secret preflight	Blocked: 2/8

The full Jest process emitted the repository-level intermittent forced-worker-exit warning after all tests passed. The focused changed suites were clean under `--detectOpenHandles`.

Safety Decision

This change improves classification and operator guidance only. It does not:

- set a readiness status;
- remove an authority blocker;
- provide a production secret or database;
- approve statutory source evidence;
- modify agent permissions or tools;
- activate an agent;
- authorize Phase 3.

Skill 017 Decision

REJECTED / NO-GO – HIGH-AUTHORITY RELEASE EVIDENCE IS INCOMPLETE

Remain on skill 017 until the six global release blockers and the separate Agent Runtime operational evidence blockers are resolved with real, immutable, independently reviewable evidence.
