# X1 product performance approval

*Review the proposed budgets, then complete and sign page 2.*

**Form reference:** X1-PRODUCT-FORM-20260903-v1 | Prepared 03 September 2026

**Status:** Prepared for signature; no decision has been recorded.

**Scope:** X1-finance-accounting-performance-budgets | Budget contract v1

This form records the product authority's decision on the targets below for Stoquify's X1 finance/accounting workflow. It becomes an approval only through the authorized decision and verified signed record described on pages 2 and 3.

## Proposed engineering budgets

| Signal | Target proposed for approval |
|---|---|
| Local sort / filter | Interaction response under 100 ms on p75 test hardware, using a bounded client dataset. |
| Server filter / sort | Loading indication under 150 ms; useful result under 1,000 ms at p75. |
| Page navigation | Useful rows under 750 ms at p75 after a cached shell. |
| Bulk action acknowledgement | Immediate job receipt, with progress and partial-result handling. |
| Preference / view hydration | No visible column-layout flash after the initial shell. |
| Browser row DOM | Bounded by pagination or a proven virtualization strategy. |
| Export duration | Measured and retained by dataset tier and export format. |

Source: current next-phase-contracts.ts and the X1 approval/evidence handoff, preserved in the review bundle identified on page 3.

### Measurement and scope

These targets are engineering acceptance budgets, not measured results or customer SLAs. The September 2 investigation found that earlier local timings included audit and screenshot overhead. Those values must not be treated as proof that these budgets passed.

Scope: non-production; database stoquify_replay_next_20260830; tenant rds_org_001; isolation probe rds_org_002. Seven finance/accounting routes are covered in English and French on desktop, tablet, and mobile. Product approval does not itself authorize credential use, data capture, or release.

# Decision and signature

*Complete this page as the appointed product authority.*

**Form reference:** X1-PRODUCT-FORM-20260903-v1

Select exactly one decision:

[ ] APPROVE as written [ ] REJECT [ ] REVISE

By selecting APPROVE and signing below, I approve budget contract version 1 and the scope stated in this form, including the exact review bundle on page 3. I confirm that I hold the product decision authority identified below. Approval authorizes evaluation against these budgets; it does not establish that the implementation meets them.

Validity: from the actual signed decision timestamp for 90 calendar days, ending earlier on revocation or a material change to the approved contract, routes, fixture scope, targets, or measurement method. A changed scope requires a new decision.

**Full legal / professional name:** _____

**Organization and title:** _____

**Product authority appointment / delegation reference:**

_____

**Approving user ID / identity mapping:** _____

The approving identity must be verified for the product_approver role when binding the manifest. A seeded persona name or role assignment alone does not establish your authority.

**Actual signed decision timestamp:** _____ (ISO-8601 with timezone)

Copy the authenticated signing event time. For an accepted manual-signature process, the register must retain verification of the actual signing time.

**Signature:** _____

Use the accepted electronic-signature workflow, or a manual signature with the verification required by your organization's controlled approval register.

**Reason for REJECT / REVISE, if applicable:** _____

_____

For REVISE, issue revised controlled text for a new decision. No option selected, an unverified signer, or an unsigned form leaves the product approval pending.

# Register the signed record

*For the document controller or approver after signing.*

A particular commercial approval platform is not prescribed here. Your organization must recognize the register and its signature-verification process. A saved file or shared-folder link alone does not establish authenticated approval.

**Approval register / controlled system:** _____

**Issued approval record ID:** _____

**Signature verification / event / certificate reference:**

_____

**Permanent signed-record URI:** _____

The URI is the reviewer-accessible link to the completed signed record and its verification evidence. Retain the approved version, its signing history, and any later revocation. Store the final signed PDF and compute its hash after signing; editing it afterwards changes that hash.

## Copy into the existing X1 intake

| Intake field | Value to copy |
|---|---|
| 1. Product decision | The selected decision from page 2. |
| 2. Product approval reference | The actual record ID issued by the recognized approval register. |
| 3. Product approval timestamp | The actual verified signing timestamp, including timezone. |
| 4. Product signature reference | The issued signature-verification, event, or certificate reference. |

For each SOURCE RECORD URI, use the permanent link above if that record exposes the corresponding value and verification evidence. Use a separate audit/certificate link where needed. This draft form reference is not a substitute for the issued approval ID.

## Exact material submitted for review

X1_PRODUCT_APPROVAL_REVIEW_BUNDLE_2026-09-03.zip

`SHA-256: c4c8f0f862135067d81dd0b2df4c9f1196d9aa6f80ddd0a7f43c418a149077db`

The bundle freezes the current budget source, table contracts, updated evidence binding, capture definitions, and investigation. It replaces the stale technical reference for this new request only. It does not amend or activate existing approval records. Register this form and bundle together before the decision is accepted.

After verified product approval, the separate credential / tenant / seeded-data authorization, fresh authenticated evidence, remaining performance measurements, and independent review must still pass. Missing or failed evidence keeps X1 blocked.
