X1 approval-system record ID and contract artifact URI guide

Date: 2026-08-31

Plain-English definitions

Approval-system record ID is the immutable identifier created by the system where an authorized human actually makes and signs the decision. It proves who decided, under what authority, what was approved, when it applies, when it expires, and which exact document and contract hashes were reviewed. It cannot be obtained from the Stoquify application database and must not be invented.

X1 contract artifact URI is the stable location of the exact technical contract package reviewed by the approver. For these policies the repository-derived URI is:

`repository://stoquify/docs/blockers-docs/X1_CONTRACT_ARTIFACT_MANIFEST_2026-08-31.json`

Its SHA-256 is `cdb16e90a74ea942e204bc8191445041a98102850619363096786768e777c9e4`.

Where to obtain the approval-system record ID

1. Use your organization's authoritative approval platform: GRC/control system, change-management system, governed ticket system, or signed document-workflow system.
2. Create a separate controlled decision for each policy unless your governance system explicitly supports one parent approval with three independently signed child scopes.
3. Record the policy ID, tenant `rds_org_001`, non-production scope, authority appointment reference, explicit decision, effective/expiry dates, contract URI/hash, final DOCX hash, and signature reference.
4. Have the formally appointed authority authenticate and submit the decision.
5. Copy the immutable record ID generated by that platform into the matching DOCX completion table.

Policy-specific approval records still required

Policy	Required human decision	Record ID status
STOQ-X1-POL-001	Product authority decides the X1 performance budgets.	Missing
STOQ-X1-POL-002	Security/control authorities authorize the exact non-production credential, tenants, persona, origin, redaction and retention scope.	Missing
STOQ-X1-POL-003	Independent release authority decides the bounded technical-gate delegation.	Missing

Technically completed values

- Contract artifact URI: `repository://stoquify/docs/blockers-docs/X1_CONTRACT_ARTIFACT_MANIFEST_2026-08-31.json`

- Contract manifest SHA-256: `cdb16e90a74ea942e204bc8191445041a9810285061936309678676 8e777c9e4`
- Policy hash manifest URI: `repository://stoquify/docs/blockers-docs/X1_POLICY_DOCUMENT_HASH_MANIFEST_2026-08-31.json`
- Database/role/persona facts remain in the individual policies and are technical evidence only.

Final DOCX SHA-256 values

Document	SHA-256
`STOQ-X1-POL-001_PRODUCT_PERFORMANCE_BUDGET_DELEGATION_DRAFT.docx`	`ea1873b12e8d6070ebbc19f9cadb3c8b02080003e71facbe05c4cf29d62514e2`
`STOQ-X1-POL-002_NONPRODUCTION_CREDENTIAL_TENANT_EVIDENCE_DELEGATION_DRAFT.docx`	`add6694ba90b62742fa6bb44224a98bc6c8d61d9332595f5b0eebd6c33da3728`
`STOQ-X1-POL-003_TECHNICAL_EVIDENCE_GATE_PROMOTION_DELEGATION_DRAFT.docx`	`e40b1d069cc77a5788a6eb5c2635622ecbeabc90776ab712dfefb9f57b882b25`

A DOCX cannot contain its own final byte hash: inserting that hash changes the DOCX bytes. The authoritative values are therefore stored in the external policy hash manifest after the DOCX files are frozen.

Verification commands

```
Get-FileHash -Algorithm SHA256 'docs/blockers-docs/X1_CONTRACT_ARTIFACT_MANIFEST_2026-08-31.json'
Get-FileHash -Algorithm SHA256 'docs/blockers-docs/STOQ-X1-POL-001_PRODUCT_PERFORMANCE_BUDGET_DELEGATION_DRAFT.docx'
Get-FileHash -Algorithm SHA256 'docs/blockers-docs/STOQ-X1-POL-002_NONPRODUCTION_CREDENTIAL_TENANT_EVIDENCE_DELEGATION_DRAFT.docx'
Get-FileHash -Algorithm SHA256 'docs/blockers-docs/STOQ-X1-POL-003_TECHNICAL_EVIDENCE_GATE_PROMOTION_DELEGATION_DRAFT.docx'
```

Important boundary

The hashes prove file integrity only. They do not prove approval, authority, signature validity, credential authorization, tenant authorization, release authorization, or production readiness.
