Platform module evidence index

Candidate and provenance

Commit a05a41ef66cd5d98fd69ae3df18225795f912232; branch codex/migration-control-plane-release-2026-08-29. Capture 2026-09-08T14:41:48.494Z. Dirty worktree retained in the baseline status file; source and schema SHA-256 records in the source manifest. Initial candidate has concurrent work; hashes, not clean HEAD, bind claims.

Source files changed between initial capture and report assembly: none among the selected hashed source files. Any later edits require revalidation. Source inventory is not a whole-repository security scan.

The user template was read from attachment 5fae8598-ad4d-4072-a227-97b9d665406e/pasted-text.txt and retained as Markdown provenance. Root AGENTS.md and the docs-report-publisher skill were read. No subordinate audit AGENTS.md was found in the report destination.

Fresh executed checks

Check	Result	What it establishes / does not establish
Source/catalog/schema/graph discovery	21 packages; 102 initially selected source files hashed	Navigation and selected current-source observations; not deployed inventory or full code-path coverage
Focused Jest run	292 passed; 1 failed; 0 pending; 19 suites	Mock/injected-client contracts; no real PostgreSQL concurrency, network provider or browser proof
Full typecheck / Prisma validate	Not run in this module review	Existing earlier accounting results are historical; no application code changed here
Deployed DB / migrations / data exposure	Not run	No deployed-constraint or historical-balance assurance
Authenticated browser/accessibility/localization	Not run	UI observations are static; no runtime certification
Provider sandbox / statutory professional approval	Not run / not supplied	No acceptance, settlement or legal determination
Load, restore, production telemetry and pilot	Not run	No performance SLO, recoverability or customer-outcome claim

Jest started 2026-09-08T14:43:08.844Z, finished 2026-09-08T14:44:14.458Z; exit 1. Exact executable/argument record; per-assertion results; log. Test runner and configuration were inspected; selected suites use mocks/injected clients. No deployment or seed script was invoked.

The failing inventory expectation received an anomaly-evidence recording error before later assertions executed. This is retained unchanged as PM-INV-001. No test or runtime source was patched to make the audit green.

Graph navigation

- graph_actions.json: 1044 nodes and 1284 links.
- graph_app.json: 622 nodes and 472 links.
- graph_components.json: 1173 nodes and 1089 links.
- graph_hooks.json: 308 nodes and 321 links.
- graph_types.json: 72 nodes and 36 links.

Graph reports date from earlier extraction; communities and selected nodes are listed per module. Some graphs infer relationships. Current import/source verification and fresh tests outrank old graph edges and historical gates.

Historical leads and shared work

- Accounting audit and ACC register: used for shared findings/ownership, not fresh pass counts.
- Enterprise roadmap and traceability register: reuse STQ-RM work and recheck source claims.
- AI value and functionality audit: historical guide; do not transfer its test or operational release results into this run.

Publication validation

The publisher renders matching PDFs for all Markdown in docs/plan-of-action. The post-publication JSON manifest records byte lengths, SHA-256 hashes, PDF signatures/pages where available, module catalog coverage, linked files and backlog dependency validation. Publisher output and validation are publication evidence only. No application correctness is inferred from document checks.
