Checkout vertical expansion — 23 September 2026

Removed the checkout sidebar's fixed viewport height and sticky positioning, the cart's nested scroll container, and the payment area's constrained flex height and vertical overflow. The checkout now grows with its contents and uses ordinary page scrolling. Existing payment and recovery behavior is unchanged.

Live browser measurements confirmed the payment area grew from 99 px with 444 px of scrollable content to 444 px with overflow visible. At a narrower browser setting, its height and content height both measured 556 px; the document had no horizontal overflow. The browser's current zoom made that setting approximately 585 CSS pixels wide. A further check targeting approximately 390 CSS pixels was inconclusive because browser evaluation timed out. Temporary viewport overrides were reset.

The existing checkout and receipt suites passed: 31 tests across two suites. Existing layout expectations were updated; no new tests were added for this styling change. ESLint and diff whitespace checks passed. No full production build or project-wide type check was run.

Baseline copies preserve the working tree at the start of this change. Production diff: seven lines changed in components/pos/ProfessionalPOSSystem.tsx. No sale or checkout recovery action was performed during this layout task.
