Findings and remediation

This register concerns gate accuracy and the safety of review tooling. It does not grant business-policy approval or production authority.

ID	Finding	Disposition	Verification / remaining limit
GC-01	Comment marker could exempt operational stock writers	FIXED: removed marker-only exemption; exact reviewed fixture and guard hashes required	Inventory negative regressions reject marker/copy/changed dependency; static scanner remains limited to direct calls
GC-02	Line-pattern scanner missed multiline/bracket/optional calls and counted inert strings	FIXED: parse actual calls with existing TypeScript parser	Pre-edit mismatch reproduced; actual-call regression passes; dynamic aliases/raw SQL remain separate review boundaries
GC-03	POS stock booster and supplier fixture could target application/nonlocal databases	FIXED: explicit dedicated disposable targets, production/redirect denial and connected identity checks	Guard tests and individual fixture invocation tests; no real fixture/database writes performed
GC-04	Imported historical fixtures could bypass their caller's ownership check	FIXED: shared client verifies connected database identity and synthetic ownership before model operations	Identity/ownership mismatch prevents write callback; eleven entrypoints reject application target before Prisma construction
GC-05	Approval gate accepted opaque signature references and arbitrary hashes without reading/verifying evidence	FIXED: independently trusted Ed25519 issuer attestations, artifact hashes, decision/contract/scope/role binding	Positive synthetic and negative tests; authentic issuer trust configuration and real approval records remain external
GC-06	Future/expired approvals and mismatched effective versions could qualify	FIXED: strict timestamp/version/expiry and fresh-auth checks	Focused regressions; clock/trust-configuration authority remains an operator responsibility
GC-07	Program could preserve declared PASSED despite missing external proof	FIXED: actual external and internal closure verification required for pass	Original false pass reproduced; forged/missing/stale/wrong-class evidence fails
GC-08	Removing dependencies or external register items could make structural checks appear complete	FIXED: canonical exact dependency and evidence sets; missing/duplicate substitutions fail	Program regression tests; intentional policy changes now require corresponding reviewed gate-contract changes
GC-09	Old candidate declaration and changed source could receive unsupported closure credit	FIXED verification: candidate HEAD, bound requirements and signed source manifest checked	Current August candidate is stale and stays blocked; issuer must attest manifest completeness and real scenario coverage
GC-10	Build wrapper inspected ordinary .next even when NEXT_DIST_DIR selected isolated output	FIXED: inspect/report actual contained output; reject outside/root/link escapes	Five new tests failed before change plus one independently identified parent-link case; 23 pass after. Existing deletion guard preserved; run uses skipClean and a new directory
GC-11	Historical gate descriptions did not reflect September cart/recovery and migration work	DOCUMENTED: current-source preflight and completed migration references	Frozen contract/program preserved; no stale NOT_IMPLEMENTED text treated as fresh runtime evidence

ID	Finding	Disposition	Verification / remaining limit
GC-12	Missing accountable decisions, external environment/hardware evidence and cashier access	OPEN EXTERNAL REQUIREMENTS: 11 decision packets, nine procedures, exact role handoffs prepared	No invented identities, business approvals, provider responses, devices or pilot outcomes

The temporary automatic-review rejection of the fixture manifest was resolved through the same approval mechanism after individual callsite review and executable guard tests supplied the missing evidence. It was not bypassed. Full chronological details remain in inventory-review.md.

Changes are confined to gate/build verification tooling, guarded fixture execution paths, their tests and this evidence package. The current financial finalizer, stock kernel, schema, existing migration history and POS production capability flags are unchanged by this run.
