Public product communication: capability and claim evidence

Assessment: 22 September 2026. Scope: the current shared working tree and the English/French landing, workflows, login and registration experiences. This is a source review, not a production availability, statutory, security or release certification. No business transaction or external message was created for this review. Existing unrelated working-tree changes were preserved.

Evidence and status rules

- **Implemented** means the behavior is present in current source. It does not establish that every deployed tenant has the feature enabled.
- **Conditional** means implemented behavior requires module access, permissions, setup, current evidence or a supported external source.
- **Partial** means a narrower implemented workflow exists while an important end-to-end or country/provider capability remains unavailable, gated or unverified.
- **Proposed** means a roadmap or conceptual journey without sufficient implementation evidence; do not present it as available.
- Test files cited below are existing verification targets, not tests rerun by this source review. Current execution and browser evidence belongs in the implementation verification report.

All public outcomes should be qualitative: help the team follow records, review differences, prepare work and understand responsibilities. Do not claim measured savings, universal accuracy, universal provider connectivity, automatic statutory acceptance or certified compliance.

Audience and page purpose

The primary audience is owners and managers of retail and distribution businesses in OHADA markets. That describes the target market, not a promise of statutory coverage across all OHADA countries. Cashiers, stock and purchasing teams, finance/accounting teams, HR/payroll teams and administrators need distinct entry points into the same connected story.

Page	Educational purpose	Appropriate depth
Landing	Explain who the product serves, important capabilities and the business value of connected records.	Capability overview, representative cross-team journeys, setup expectations and a clear link to workflows.
Workflows	Explain how work passes between roles, modules and review steps.	All crucial journeys, actors, records carried forward, automatic versus human actions, outcomes, prerequisites and role/objective exploration.
Login	Orient returning users while keeping sign-in immediate.	Short reminder of connected work plus optional workflow link; no mandatory tour.
Registration	Explain what account creation produces and how setup follows.	Account → email verification → sign-in → module/location/item/access setup, with a short value summary and workflow link.

Capability coverage matrix

Evidence paths are repository-relative. Public placement identifies the intended information structure; the implementation report must record the actual rendered placement.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Sales, POS and receipts — conditional	Cashier, owner, accountant; sales and cash records need a common source.	Cashier opens a session and commits a sale. Tracked item lines pass to stock issue; captured payments and the sale pass to accounting posting.	Sale/receipt, stock movement, payment and journal references. Cashier close and finance review remain separate actions.	Active terminal/session/location, items, enabled modules, permissions, stock and accounting settings. Recorded payment is not proof of bank settlement.	`services/pos/pos.service.ts:2477` calls `postPOSStockIssue`; `:2667` calls `postSale`, followed by `postPayment`. `services/accounting/postings/post-sale.ts`. Existing `services/pos/__tests__/pos.service.test.ts`.	Landing Sales; workflows `sellToCash`; brief login example.
Inventory, locations, adjustments and transfers — conditional	Stock team and managers; quantities and value must follow the source movement and location.	Receive, issue, transfer or correct stock. A transfer connects source and destination; tracked sales issue stock.	Quantities, movement references, valuation evidence and exceptions for review. Approval-controlled locations require a separate approver for a transfer.	Active items/locations, sufficient stock, permissions, reason/source and valuation rules. Do not claim stock is always accurate or instantly synchronized everywhere.	`services/inventory/inventory-stock-event.service.ts:911,1004`; `services/inventory/inventory-transfer.service.ts:230,531,703`; `services/inventory/inventory-transfer-lifecycle.service.ts`. Existing inventory service tests.	Landing Stock and locations; workflows `stockToSale`; purchasing/sales handoffs.
Purchase orders and goods receipt — conditional	Purchasing, receiving team, manager; orders and receipts must stay linked.	Prepare/submit order → authorized approval → record receipt and inspection. Accepted receipt calls the stock event service.	Purchase order, received quantities, inspection outcome and resulting stock movement. Failed/pending inspection is a real review boundary.	Supplier, item and receiving-location setup; order state, authority and accepted inspection. Do not imply every delivered item immediately becomes usable stock.	`services/purchase-order/purchase-order.service.ts:790,810,911,1124,1259`; `applyInventoryReceipt` calls `postGoodsReceiptStock` at line 394. Existing `services/purchase-order/__tests__/purchase-order.service.test.ts`.	Landing Purchasing; workflows `procureToPay`.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Supplier invoices, payables and payment preparation — conditional	Purchasing and finance; establish what was received, invoiced and approved for payment.	Received/order evidence → invoice preparation and matching → exception review/approval → payment approval/release record.	Supplier balance, payable, review history and outbound payment/reconciliation evidence. Ledger status can be blocked pending rules.	Received-order sources, reviewed bank details, invoice/payment authority, country/accounting mappings. A release record is not a promise of bank execution or settlement.	`services/purchasing/ap-control.service.ts:1714,2159,2190,2372,2568,3148,3438`; payment transaction/evidence construction at lines 1097–1184. Existing `services/purchasing/__tests__/ap-control.service.test.ts`.	Landing Purchasing and money; workflows `procureToPay` and reconciliation.
Customers and receivables — conditional	Owner, finance and accountant; follow customer obligations and collections.	On-account sale → posted receivable document and customer ledger entry → collection settlement history → outstanding-position review.	Customer/source trail, due position, receipts and ledger reference. Credit-limit checks apply at on-account sale.	Customer record, credit policy, permissions, accounting and collection evidence. No guaranteed collection outcome.	`services/pos/pos.service.ts` on-account block immediately before line 2667; `services/accounting/customer-receivable-document.service.ts:122`; `services/accounting/customer-receivable-lifecycle.service.ts:300,350`; `actions/accounting/customer-statement.actions.ts`.	Landing Customers and collections; workflows `customerToCollection`.
Payments, reconciliation and unresolved differences — conditional	Finance, accountant and owner; compare recorded money with available evidence.	Configure supported account and import/capture evidence → run comparison → review matched/missing/mismatched items → resolve differences with review history.	Reconciliation run, match decision, exception/suspense record and retained proof. Human resolution/sign-off remains distinct from automatic comparison.	Supported account/source, active rail, approved settlement account, imports, permissions and ledger mappings. No claim that every bank/mobile-money provider is connected.	`services/reconciliation/payment-reconciliation-run.service.ts:247` loads and validates provider setup; `services/reconciliation/payment-reconciliation-manual-match.service.ts`; `services/reconciliation/payment-suspense-workflow.service.ts`; `services/reconciliation/__tests__/payment-reconciliation-auto-match.test.ts`.	Landing Payments and reconciliation; workflows `paymentReconciliation`; linked from sales, AP, receivables and payroll.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Accounting journals, review and close — conditional	Accountant and owner; retain the operational source behind accounting and period review.	Operational posting → journal/source review → account reconciliation → close checks → assigned findings, missing-evidence responses and accountant review → close pack.	Journals, blockers, review history and evidence pack. Later source changes can invalidate earlier close evidence.	Reviewed accounts/rules, opening data, periods, sufficient current evidence and reviewer permissions. Internal close status is not an external audit opinion or statutory certification.	`services/accounting/postings/post-sale.ts`; `services/accounting/close-assurance.service.ts:2387,2844,3042,3540,3886,4314`; `services/accounting/close-assurance-pack.service.ts:1797,1935`.	Landing Accounting and close; workflows `accountingCloseAssurance`; cross-links from operating journeys.
Accountant collaboration — conditional	Owner and invited accountant; permit controlled client review.	Authorized grant with consent → time-bounded read/export/review access → review findings and source evidence.	Grant/consent history, client portfolio and review context. Access can expire or be revoked.	Existing accountant identity, explicit grant, role and validity period. Do not imply unrestricted access for any invited person.	`services/accounting/accountant-access.service.ts` defines READ/EXPORT/REVIEW capabilities, consent evidence and effective status; `actions/accounting/accountant-access.actions.ts`.	Workflows accounting close and access; landing accounting detail.
People, contracts, attendance and payroll inputs — conditional	HR/payroll manager and authorized supervisors; establish reviewed employee facts before calculation.	Employee identity/contract/compensation/time records → readiness proof → frozen attendance/input evidence → payroll preparation.	Current source records, missing-input blockers and payroll-ready evidence. Changed or unready source proof is rejected.	HR/payroll access, employee/contract setup, approved compensation and time inputs, period and country setup.	`services/hris/employee.service.ts`, `contract.service.ts`, `time-leave.service.ts`; `services/hris/payroll-readiness-contract.ts:396,440,456`; `services/payroll/payroll-control.service.ts:5151`.	Landing People and payroll; workflows `peopleToPay`.
Payroll calculation, review, payslips and accounting — partial / conditional	HR/payroll, finance and employee; carry reviewed inputs through review and employee records.	Calculate → review → approve → emit payslips/post payroll → prepare payment batch. Employee accesses own permitted payslip.	Payroll run, payslip, journal and payment preparation evidence. Approval, posting, release and settlement are different states.	Supported/reviewed country capability, payroll+accounting modules, account mappings, journal, inputs and permission. Current Cameroon IRPP fixtures retain an explicit full-production blocker. Do not promise complete payroll compliance.	`services/payroll/payroll-control.service.ts:5349,6800,6947,7149,7451,8221`; `services/payroll/payroll-setup-readiness.service.ts:420,597,768`; `services/payroll/payslip-self-service.service.ts:348,596`; `services/regulatory/country-packs/cameroon.ts:1019`.	Landing qualified People/payroll summary; workflows `peopleToPay` with prominent setup condition.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Payroll declarations and payment evidence — partial / conditional	HR/payroll, finance, country reviewer; track prepared records separately from external acceptance.	Approved run → prepare declaration → attach authority evidence → track payment proof → reconciliation/register review.	Declaration packet, lifecycle state, payment trace and ledger reference. External submission, acceptance and settlement need independent evidence.	Supported channel/country, approved run, permissions, actual external evidence and reviewed rules. Avoid "file automatically" or "pay everyone automatically."	`services/payroll/payroll-control.service.ts:9298` ; `services/payroll/declaration-lifecycle.service.ts` ; `services/payroll/payment-evidence.service.ts` ; `services/payroll/payment-reconciliation.service.ts` ; `services/payroll/payroll-adapter-registry.service.ts` .	Workflows `payrollStatutoryProof` ; land under people/payroll expanded education.
Country features, tax evidence and obligation review — partial	Accountant, country/compliance reviewer and owner; understand what is supported and what needs review.	Select country/context → inspect rule provenance and document/adapter state → collect evidence → review gaps.	Capability status, document state, missing obligations and explicit limitations.	Current bundled country registry contains CM only. Registered fiscal adapters are fake sandbox and Cameroon DGI sandbox. Production tax-authority automation requires additional official specifications and review.	`services/regulatory/country-packs/registry.ts:4` ; `services/compliance/adapters/registry.ts` ; `services/compliance/adapters/cameroon-dgi-sandbox.ts:133` ; `services/compliance/compliance-center.service.ts:131,488` ; `services/regulatory/country-packs/cameroon.ts:1046` .	Workflows `complianceCountryEvidence` ; concise country/setup qualification on landing and registration .
Reports and daily management — conditional	Owner, manager and authorized team lead; know where attention is needed and return to the underlying record.	Choose period/location → read operational summaries and action queues → open source → assign/review a decision.	Sales, item/cash reports, queues and source-linked exceptions with freshness/scope context.	Recorded operations, location/module permissions and sufficiently current data. Missing cost evidence may return unavailable profit; reports explicitly classify themselves as internal management reports.	`services/analytics/financial-reports.service.ts:199,243,273,299,332` ; `services/manager-action-center/manager-action-center.service.ts:118,131,261` ; `services/owner-war-room/owner-war-room.service.ts:82` .	Landing daily oversight; workflows `ownerDailyControl` ; login orientation.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Team access, invitations, locations and modules — implemented / conditional	Administrator and owner; set who can see and do work in each area.	Invite user → assign authorized role/location scope → review modules and dependencies → inspect effective access.	Invitation, effective access, module state and audit history. Module selection and operational readiness are separate.	Administrator authority, organization membership, approved scope, module dependencies and configuration. Avoid claiming every module becomes active at signup.	`services/users/member-access.service.ts:10` ; `services/users/user-invitation-issuance.service.ts` ; `services/modules/module-entitlement.service.ts:89,196,258` ; `services/modules/module-admission.service.ts:62` .	Landing administration detail; workflows `adminAccessControl` ; registration setup expectations.
Workflow checks, incidents and review decisions — conditional	Owner, administrator and accountant; see operational issues and the responsible reviewer.	Check results → scoped incident/impact → assigned review → recorded decision and follow-up.	Incident history, check freshness and review/waiver state. Actual stopping of new work depends on configured module policy.	Configured checks, data, permissions and rollout/enforcement mode. Do not claim every workflow is universally blocked or every release certified.	`services/assurance/assurance-control-tower.service.ts:90` ; `services/assurance/assurance-incident.service.ts` ; `services/modules/module-admission.service.ts:84` .	Workflows `workflowAssuranceGates` ; landing cross-cutting approvals/oversight.
Offline POS capture and replay — partial / conditional	Enrolled cashier and manager; retain supported offline events and review synchronization issues.	Supported enrolled device captures event → reconnect/ingest → verify envelope/session → replay accepted sale through POS → review conflicts.	Provisional event, pending replay or confirmed server evidence. Accepted upload alone is not completed sale posting.	Enrolled active device, terminal/session evidence, supported payload and successful replay; conflicts may require manager review. No universal always-offline claim.	`services/pos/offline-sync.service.ts:626,883,1275,1955` ; `services/pos/offline-review.service.ts` ; `services/pos/offline-resolution.service.ts` .	Deeper sales workflow prerequisite/extension; omit unconditional landing promise.
Guided assistance and automation — partial / conditional	Authorized manager; understand recorded evidence and possible next steps.	Role digest/evidence → enabled Command Agent brief → human opens workflow or reviews separate proposal.	Read-only brief and run evidence; no autonomous posting or approval.	Organization/role rollout, authorized definition, modules and source freshness. Broad AI automation is not substantiated by this path.	`services/agents/command-agent.service.ts:63` checks rollout and invokes deterministic read-only digest; `services/agents/agent-policy.service.ts` prohibits write tools and posting/approval patterns; `actions/ai/copilot-proposal.actions.ts` .	Optional deeper daily-oversight explanation; avoid primary autonomous-AI promise.

Capability / status	Audience and problem	User action → connected handoff	Result and important review	Prerequisites / public qualification	Current source evidence	Public placement
Account creation and verification — implemented, delivery conditional	New administrator; understand the account/setup boundary.	Enter organization/admin details and accept terms → create unverified identity → email verification → sign in → workspace setup.	Organization, admin identity, verification destination and retained registration context. Default location depends on v2 onboarding or supplied first-branch name.	Valid registration data, password policy, terms acceptance and successful verification delivery. Form submission does not establish ready accounting/payroll/provider configuration.	`services/users/user-identity.service.ts:392,514,545,600,617`; `hooks/useRegisterWorkflow.ts:62`; `components/auth/BeautifulRegisterForm.tsx`.	Registration prominently; matching landing CTA; login return path.

Recommended connected explanation

Use these as public explanations with the prerequisites above, not as a claim that every action is automatic:

1. **Sell and collect:** cashier records sale → the system links tracked stock and recorded payment/accounting entries → cashier reviews drawer → finance compares available payment evidence and reviews differences.
2. **Purchase and receive:** purchasing prepares order → authorized reviewer approves → receiving records accepted goods → stock updates from accepted receipt → finance checks supplier invoice and payment readiness.
3. **Move and review stock:** stock team requests/records movement → required approver reviews → source/destination movements retain their references → manager reviews quantity/value differences.
4. **Follow customer collections:** on-account sale creates a customer obligation → finance records collection and settlement evidence → outstanding position and differences remain reviewable.
5. **Prepare people and payroll:** HR reviews identity, contract, compensation and time inputs → payroll readiness checks expose missing information → authorized payroll review controls run/payslip/accounting stages within supported country scope.
6. **Review and close:** operating records support journals → accountant reviews reconciliations and evidence gaps → responsible teams resolve or respond → the reviewer assembles the internal close evidence pack.
7. **Run the business each day:** managers review current scoped signals → open the original record → assign work or review a decision → return to the operational workflow.

For every visual connection, label what passes: sale reference, stock movement, accepted receipt, invoice, customer obligation, payment proof, reviewed employee inputs or journal reference. Mark meaningful actor changes and human approval steps in plain language. “Recorded”, “reviewed”, “released” and “settled” must not be used interchangeably.

Existing knowledge graph used for discovery

`graphify-out/graph_actions.json` was inspected. Its relationships predate the present working tree and were verified against current source, not treated as availability evidence.

Graph node	Community	Relationship investigated
`purchaseorderworkflow_purchaseordersystemaction_ts`	2	Purchase action path → service approval/receipt → accepted stock event.
`purchasing_ap_control_actions_ts`	26	AP actions → invoice/payment review services and reconciliation evidence.
`inventory_inventorymovementactions_ts`	93	Inventory action → stock movement source/quantity boundaries.
`payments_reconciliation_actions_ts`	14	Reconciliation action → supported account/evidence comparison.
`accounting_customer_statement_actions_ts`	81	Customer statement → posted receivable/source history.
`accounting_close_assurance_actions_ts`	6	Close action → checks, missing evidence and accountant review.
`payroll_payroll_control_actions_calculatepayrollrunaction`	5	Payroll calculation/approval path → reviewed inputs and country setup.
`payroll_payroll_country_pack_review_intake_actions_ts`	17	Country review intake → gated payroll scope.
`manager_action_center_manager_action_center_actions_ts`	114	Daily manager queues → scoped records and freshness.
`owner_war_room_owner_war_room_actions_ts`	117	Owner overview → source-backed operating signals.
`agents_command_agent_actions_ts`	105	Command agent → rollout-controlled read-only digest.
`ai_copilot_proposal_actions_ts`	84	Proposal generation/decision boundary; no autonomous business mutation promise.

Review-lens decisions

Lens	Decision and scope
Enterprise/platform architecture	Applicable: distinguish linked records, modules, configuration and operational readiness; no platform redesign.
Backend/API/domain/integration	Applicable: verify actual handoffs and automatic versus human stages from services.
Database/data integrity	Applicable: source references and prerequisite data underpin claims. Schema/migrations are not applicable: no persistence change is required.
Application security, IAM and privacy	Applicable: preserve tenant/role/location/module boundaries; use synthetic/public evidence only. No security/privacy certification is made.
Frontend/design systems	Applicable: coherent public presentation and existing components; implementation reviewed by the delivery task.
Workflow UX, accessibility, localization and content	Applicable: actor/record/outcome clarity, equivalent EN/FR and operable role/objective exploration. Accessibility conformance certification is not established by source review.
Product/business process	Applicable: owners/managers are primary; all crucial functional areas have deliberate placement.

Lens	Decision and scope
Finance/accounting/reconciliation/internal controls	Applicable: payment recording, approval, settlement, journal and close review are distinct.
Country/statutory/OHADA	Applicable only to qualifying scope. Legal/tax-rate advice and statutory certification are not applicable: no new rule or authoritative compliance opinion is delivered.
Quality/release	Applicable: public routes and preserved form behavior need focused validation. This source review does not run tests or certify release.
SRE/DevSecOps/performance/cost	Applicable to public rendering, dependencies and truthful availability language. Infrastructure rollout and cost benchmarking are not applicable: no infrastructure change is requested.
Offline/provider boundaries	Applicable: pending replay, supported sources and sandbox channels need explicit limits.
Analytics/data governance	Applicable: source provenance, scope, freshness and unavailable evidence must remain truthful.
AI/agent governance	Applicable to optional assistance wording: read-only and rollout/role gated. Model training/evaluation expansion is not applicable.
SaaS packages/growth/customer success	Applicable: account creation and adoption expectations must match module entitlement and setup. Pricing and billing changes are not applicable.

Source-verifiable limitations and exclusions

1. **Approved policy destinations are missing in the current source tree.** `components/auth/BeautifulRegisterForm.tsx:533,537` links localized `/terms` and `/privacy`. No corresponding route files were found under `app`, and no terms/privacy rewrite was found in `middleware.ts` or `next.config.mjs`. This is source evidence of a pre-existing destination gap; live route status needs browser verification. Preserve required acceptance and request approved policy content through a separate follow-up rather than inventing legal text.
2. **Real email delivery was not exercised.** Registration calls `sendVerificationEmail` and returns `verificationRequired: true`; this establishes intended sequence only. Mailbox delivery, real new-account onboarding and live login success need environment-specific evidence.
3. **Country and payroll breadth is limited.** The static country registry lists Cameroon; fiscal adapters are sandbox only, and an IRPP full-production blocker remains explicit. OHADA audience positioning must not become a promise of every member country's payroll/tax support.
4. **External settlement and authority acceptance are unproven here.** Public explanation can describe records and evidence review. It cannot claim live universal connectors, payment execution or acceptance by authorities.
5. **Offline and assistance are conditional extensions.** Their supported states belong in deeper explanations, with local qualifications. Do not headline “always offline” or “autonomous finance.”
6. **Roadmap-only ideas are excluded from available-feature claims.** No proposed module was promoted based only on historical reports or graph nodes. If retained for future design, label it proposed in internal artifacts and keep it out of present-tense public capability claims.
7. **The embedded July 2026 product image remains historical evidence.** The earlier claims assessment records the historical screenshot date as 18 July 2026. Do not call it live data or current customer results; preserve visible bilingual illustration/history labeling if reused.

Prior research consulted as leads: `docs/landing-message/results-2026-09-19/claims-assessment.md`. Current code supersedes older prose when they differ, including the default-location v2/supplied-branch condition.
