# Public product communication — implementation and verification

Started: 22 September 2026. Verification finalized: 23 September 2026. Workspace: `E:\ohada saas\Focused projects\stoquify`.

## Delivered experience

Implemented the requested communication across **landing, workflows, login and registration**, in **English and French**. The workflow page is the detailed educational destination, linked from the other three surfaces.

- The landing page now explains eight capability groups through concise, expandable cards, each with a business outcome, connected record flow and link to an actual workflow.
- The workflow page explains all twelve existing business journeys with prerequisites, responsible roles for every step, information passed between modules, human review/approval boundaries, retained records and practical outcomes. Existing role and business-objective exploration remains available; controls wrap on small screens. Payroll's six steps are now all visible in its expanded explanation.
- Login keeps the form first and immediately usable, with a short connected-workspace guide beside it on desktop and below it on smaller screens.
- Registration preserves the existing three-step form and consent. It explains account creation, email verification, sign-in and workspace setup, with the same optional workflow guide.
- All four experiences use the existing brand, typography, icons and design tokens. Native disclosures provide progressive explanation without mandatory tours or new animation. Contrast issues found during browser verification were corrected using existing tokens.
- Final editorial review replaced inherited technical labels with business language and rewrote the visible French workflow steps, controls and record labels for natural reading. Message changes are confined to `landing.workflowAtlas`; other translation content was preserved.

## Information hierarchy and placement

| Surface | Content order and purpose |
|---|---|
| Landing | Existing positioning and actions → practical benefits → eight capability groups → representative connected journeys and existing product evidence → setup expectations and next action. |
| Workflows | Connected-work explanation and availability → role/objective selection → relevant starting points → journey index → complete expandable playbooks → account action. |
| Login | Credentials, recovery and feedback → optional three-stage sales/stock, payment-review and accounting guide → localized workflow link. |
| Registration | Account and setup expectations → existing fields and validation → verification/setup/team next steps → optional connected-work guide and localized workflow link. |

Landing groups cover sales/customers, stock/locations, purchasing/suppliers, payments/reconciliation, people/payroll, accounting/close, daily decisions/reporting, and access/country requirements. The twelve playbooks cover sales, stock, purchasing, customer collections, reconciliation, payroll, payroll proof, accounting close, country evidence, daily management, access administration and workflow checks.

The capability and claim-evidence matrix covers eighteen important areas with audience, action, handoff, outcome, prerequisites, current source evidence and placement. Accountant collaboration is explained within accounting/access. Offline replay, external integrations and guided assistance remain qualified extensions in the deeper workflow copy. Unimplemented or unsupported claims are excluded. No crucial verified area was intentionally omitted from the information structure.

## Claim boundaries

The new copy distinguishes recorded payments from settlement, accepted goods from pending inspection, account creation from configured modules, internal close review from external certification, and preparation of country records from authority acceptance. Payroll statutory limitations, sandbox fiscal integrations, provisional offline events and read-only guided assistance are qualified beside the relevant explanations.

Existing product imagery retains its illustrative/historical context. No testimonials, customer statistics, measured savings, universal provider support or compliance guarantees were added. The claim review used existing graph nodes to locate relationships, then verified them against current source. Reviewer decisions and immaterial lenses are recorded in the matrix.

Complete final copy is saved in final-bilingual-copy.json, including the new capability and workflow education, auth guide, existing landing copy and workflow messages. auth-implementation.md records the account-flow evidence and narrow contrast changes.

## Implementation scope

Presentation changes are limited to the home composition, landing hero/capability/workflow components, bilingual copy, the auth layout and supporting guide, and narrowly scoped form color classes. The workflow route uses its existing shared atlas component. Login and registration routes use their existing shared auth layout.

The public smoke manifest and command now explicitly include both workflow routes. Focused tests cover those public routes, bilingual guidance completeness, valid capability-to-journey destinations and all payroll steps.

No backend behavior, database schema, authentication handlers, authorization, tenant boundaries, module entitlements, redirects, verification, consent, referral handling, submission protection, pricing or deployment was changed. The new education adds no package dependency or authenticated request. Pre-edit source copies and baseline-status.txt preserve the starting state of this already-dirty workspace. changed-source-hashes.json identifies the final nineteen implementation/test files; a diff against Git HEAD also includes earlier work and should not be attributed entirely to this task. The source test baseline was reconstructed by reversing its three documented wording assertions after its initial backup encountered a missing directory; other captured source baselines are exact pre-edit copies.

## Verification

| Check | Result and evidence |
| --- | --- |
| Public baseline | 21 tests passed; baseline-tests.json. Sixteen baseline screenshots captured across eight routes at desktop/mobile widths. |

| Check | Result and evidence |
| --- | --- |
| Focused public, workflow and authentication regressions | **7 suites / 43 tests passed**; final-focused-tests.json. Includes both requested public-content/landing-refinement gates, workflow component/source tests, public-route manifest tests and auth regressions. |
| Authentication after final contrast edits | **2 suites / 9 tests passed again**, with five changed auth files passing focused lint; auth-implementation.md. |
| TypeScript | `tsc --noEmit --pretty false` completed with exit 0; typecheck.log is empty because no diagnostics were emitted. |
| Focused public lint | Passed with exit 0; public-lint.log. |
| Final browser rendering and interaction | **8 routes × 4 widths = 32 checks passed**; verification-summary.json. Widths: 320, 390, 768 and 1440 pixels. Every route returned HTTP 200 with correct document language, one H1, no duplicate IDs, no horizontal overflow and no uncaught page errors. |
| Automated accessibility | **8 desktop scans, zero reported violations** for the selected WCAG A/AA rules. Incomplete checks remain recorded for manual review. This is scoped automated evidence, not accessibility certification. |
| Existing public smoke command | **Passed for all eight routes**, with required desktop/mobile screenshots; route-smoke.json, route-smoke.log. The workflow routes were rechecked separately after the final editorial correction. |
| Safe production build | **Blocked during standalone packaging, exit 1.** Compilation, type checking and all nine generated pages passed. Windows refused dependency symbolic-link creation ( `EPERM` ). Six lint warnings concern files outside this task. Build result · complete log. No migration ran. |
| Existing policy destinations | `/en/terms` , `/en/privacy` , `/fr/terms` , `/fr/privacy` all returned **404**; policy-links.json. |

Browser interactions exercised localized workflow links, keyboard-operated capability and journey disclosures, purchasing-role filtering, the resulting five-step purchasing explanation, and login required-field errors. Existing workflow tests cover role/objective combinations and resulting journey sets. Auth tests use mocks and cover submission safety, recovery after uncertain outcomes, retained values, referral context and existing registration behavior. They do not establish delivery of a real verification email or a successful live sign-in.

Visual review included the landing desktop layout, login desktop layout, expanded workflow at 390 pixels and French registration at 320 pixels. The narrow registration layout preserves every explanation after the form. Browser runs requested reduced motion; the added static guides/disclosures introduce no motion dependency.

## Screenshot index

Each final surface has additional 320- and 768-pixel evidence in the same directory. Expanded workflow exploration screenshots are included for both languages at all four widths.

| Route | Before desktop / mobile | After desktop / mobile |
| --- | --- | --- |
| `/en` | 1440 · 390 | 1440 · 390 |
| `/fr` | 1440 · 390 | 1440 · 390 |
| `/en/workflows` | 1440 · 390 | 1440 · 390 |
| `/fr/workflows` | 1440 · 390 | 1440 · 390 |
| `/en/login` | 1440 · 390 | 1440 · 390 |

| Route | Before desktop / mobile | After desktop / mobile |
|---|---|---|
| `/fr/login` | 1440 · 390 | 1440 · 390 |
| `/en/register` | 1440 · 390 | 1440 · 390 |
| `/fr/register` | 1440 · 390 | 1440 · 390 |

### Earlier findings retained separately

- The baseline encountered two cold-development `Invalid or unexpected token` page errors. They were absent from the final thirty-two checks.
- The first interaction run clicked before the development route hydrated. Waiting for the client bundle resolved the test race; the diagnostic is saved in `hydration-debug.json` and the initial results are retained separately.
- Initial automated scans identified contrast failures. Final targeted workflow/login/registration runs supersede those earlier scans; the consolidated result selects the unchanged successful home run and each latest corrected surface run.
- The final editorial pass invalidated three old wording expectations in one existing test. Those assertions were updated to the requested English/French copy while retaining the workflow, payroll, declaration and ledger checks. The subsequent complete focused run passed all forty-three tests; the intermediate failure is preserved in `editorial-copy-expectation-tests.json`.
- Pre-final production attempts were stopped for the final contrast and editorial corrections, because the compiler held mapped source files. Their logs are retained as `build.log` and `build-final.log`. The 22 September source-stable attempt stopped during trace collection when the task was interrupted; its log is `build-release-check.log`. On 23 September, all nineteen file hashes still matched the verified source. The resumed safe build compiled successfully in 2.3 minutes, passed type checking and page generation, then failed while creating symbolic links for the standalone package. This is a confirmed packaging failure, not a successful complete production build or a timeout.

The task's two temporary generated-type includes were removed from `tsconfig.json`, preserving every unrelated setting. The generated type reference was restored to the previously observed normal development directory when necessary. Cleanup is recorded in configuration-cleanup.json, and the consolidated verification includes the final source-hash comparison and build result.

## Remaining limitations and follow-up

1. **Production packaging is blocked by symbolic-link permissions.** The safe build exited 1 during standalone dependency copying with `EPERM`. Compilation, type checking and page generation succeeded. Complete the same build in an environment that permits the required symbolic links before deployment. No machine security setting or packaging requirement was changed to bypass this failure.
2. **Approved legal destinations are missing.** Existing Terms and Privacy links still return 404. Required consent was preserved. Supply approved localized policy pages in a separate task; no legal text was invented.
3. **Live authentication and email delivery remain unverified.** Exercise real verification, invitation context and successful sign-in in the intended environment using approved test accounts before launch. This task created no account or external message.
4. **Native browser zoom and screen-reader verification remain outstanding.** Both browser-control connection attempts timed out. Viewport reflow was verified at the requested widths, but it is not

evidence of native zoom or screen-reader behavior. Complete those manual checks and review the automated scanner's incomplete items before claiming conformance.

5. **Product availability remains conditional.** Module access, permissions, setup, supported country scope and external evidence determine usable workflows. No financial, statutory, security, privacy or release certification is made here.

The delivered pages are available in the local preview at `http://127.0.0.1:3011/en` and `http://127.0.0.1:3011/fr`. No migration or deployment was performed.
