Execution Findings and Risks

Implemented

- Skill name is now `stoquify-prompt-execution-roadmap-publisher`.
- The skill is located under the project's `.agents/skills/` directory.
- Publication is fixed to `docs/prompt-execution/`.
- The required five Markdown/PDF basenames are deterministic.
- The workflow explicitly uses `aqstoqflow-prompt-architect` first.
- Execution, findings, roadmap and executive-summary stages are defined.
- The workflow requires evidence capture and honest blocker reporting.
- Existing `docs-report-publisher` is reused for PDF generation.
- Safety rules prohibit destructive, external, regulated and unauthorized actions.

Partial or blocked

- The project skill validator was invoked but could not run to completion.
- The system Python shim was unavailable.
- The bundled Python runtime lacked the `yaml` module required by `quick_validate.py`.
- A dry-run/fixture execution of the new skill is not certified by the validator in this environment.

Risks

Risk	Impact	Control
Validator dependency missing	Skill quality is not formally validated	Provide a Python runtime with PyYAML, rerun the validator and retain its output
A raw prompt could imply unsafe mutations	Unauthorized changes or external effects	Classify risk before execution and require explicit authority for destructive or external actions
Reports could overstate execution	Misleading project decisions	Record commands and statuses as passed, failed, skipped or blocked
Report files could drift in naming	Broken publication invariant	Keep the five basenames fixed and validate same-named PDFs
Sensitive output could enter reports	Privacy or security exposure	Redact secrets, credentials, payroll, provider and tenant-sensitive data

Not applicable

- Live lender, insurer and payment-provider integration: not applicable to this local skill installation.
- Database migration: not required for the skill artifact.
- UI/browser verification: not required for this skill-only change.
