Isolated next-level database baseline — blocker register

- Decision ID: `USER-DIRECTIVE-20260830-ISOLATED-RESEED`
- Captured at: `2026-08-30T20:52:55+01:00`
- Authorized technical scope: create, reset, migrate, seed, and verify only `localhost:5432/stoquify_replay_next_20260830`
- Tenant scope: `rds_org_001`, `rds_org_002`
- Previous database: `stoquify_dev_migrated_20260814` — preserved and not reset
- Evidence source: the user's instruction in the current Codex task to proceed using the supplied blocker list
- Approval classification: `UNVERIFIED_CHAT_DIRECTIVE`
- Approver identity/control role: `UNVERIFIED`

The chat directive is sufficient evidence for the requested local development operation, but it is not an authenticated control-owner approval, signed ticket, or production authorization.

Verification summary

- Fresh replay: 80 of 80 migrations applied; no missing, unknown, unfinished, rolled-back, or checksum-mismatched migration.
- Migration status after final seed: database schema is up to date.
- Seed: completed for two isolated demo tenants; 98 login personas generated without printing plaintext passwords.
- Read-only verification: `PASS`; PostgreSQL reported `transaction_read_only=on` inside the verification transaction.
- Inventory: 20 active, valid, stocked items at every active location.
- Finance: DRAFT, POSTED, REVERSED, and VOIDED journals; XAF, EUR, and USD; open and closed periods; balanced non-void journals; AR/AP, payments, refunds, match/suspense, cash history, close evidence, and accounting source links.
- RBAC: all ten required personas exist in both tenants. `external_accountant` has an explicit finance read/export allow-list and no journal mutation, approval, reversal, or period-close permission.
- Contract tests: 10 passed.

Blocker disposition

Blocker	Status	Evidence / residual
TRB-001	CLOSED	Dedicated local replay database created; destructive operations were restricted to its exact name.

Blocker	Status	Evidence / residual
TRB-002	CLOSED	Exact bilingual `external_accountant` role and explicit permission contract seeded and verified. Export is permitted only through the finance-export permission; its role policy requires server-finalized, audited, and redacted output.
TRB-003	OPEN — GOVERNANCE	This record captures the user directive, exact target, tenants, timestamp, and decision. The approver's authenticated identity and control-owner role remain unverified and must not be inferred.
TRB-004	PARTIAL	Required accounts, roles, active state, credential hashes, and login verification are complete. The credential artifact is local and git-ignored; an approved external secret-manager location has not been supplied.
TRB-005	OPEN — UI EVIDENCE	Authenticated desktop/tablet/mobile, EN/FR, persona, and accessibility browser evidence was not produced by this database operation.
TRB-006	CLOSED — DATA	Finance fixture coverage and balances passed the read-only data gate. Rendered/exported statement UI evidence remains part of TRB-005.
TRB-007	CLOSED	Canonical verification is database-enforced read-only; the write-capable POS flow is a separately named smoke command.
TRB-008	OPEN — PROCESS LOCK	Prisma generation remains blocked by a Windows `EPERM` lock held by the running application process. No Prisma schema change was made, so the existing generated client remains compatible. Stop the locking process and rerun `npm run prisma:generate`.
TRB-009	MITIGATED	Certification artifacts were written to unique report paths. The generic Windows lock condition may recur while another process holds a report file.
TRB-010	CLOSED	The seed and verifier require and confirm 20 curated products per active location with valid stock arithmetic and references.

Evidence artifacts
