

Landing Page Modernization Run Report

Date: 2026-07-17

Prompt run: docs/landing page/landing-page-modernization-prompt.md

What Was Updated

- Reframed the landing page around Stoquify as a ledger-first OHADA operating system, not a generic POS, inventory, or accounting app.
- Updated the English and French landing namespaces for the hero, dashboard mock, operating model, product gallery, trust section, pricing, final CTA, and footer.
- Expanded the public operations module grid so reconciliation and payroll are visible alongside POS, inventory, purchasing, finance, accounting, and compliance.
- Refreshed the hero dashboard mock activity values from generic dollar/branch samples to XAF, transfer, supplier approval, and payment-proof language.
- Preserved the existing route, component structure, localization pattern, and visual system.

Files Changed By This Run

- messages/en.json
- messages/fr.json
- components/landing/operations-map.tsx
- components/landing/hero-dashboard.tsx

Verification Performed

- JSON parse check for messages/en.json and messages/fr.json: passed.
- Focused ESLint for the two edited landing components: passed.
- npm run typecheck: attempted, but timed out after 120 seconds without captured diagnostics.

What Was Verified

- The localized landing copy now foregrounds POS, inventory, payments, reconciliation, accounting, compliance, payroll, evidence, and close control as one operating system.
- The visible module grid includes existing reconciliation and payroll routes.
- The edited TypeScript landing components pass focused ESLint.
- The edited locale files remain valid JSON.

Residual Launch Risk

- A browser smoke and responsive screenshot review were not completed in this run; run desktop and mobile checks before production release.
- The broader worktree already contains many unrelated changes and long-path warnings under what-next; review landing-specific diffs separately before staging or release.
- Full typecheck remains unconfirmed because the command exceeded the 120 second execution window.

- Product and legal owners should confirm OHADA/SYSCOHADA readiness wording against the current certified capability set before external launch.
