

Public And Auth First-Impression Run Report

Date: 2026-07-17

Scope: landing page expansion plus login/register positioning alignment.

What Changed

- Expanded the landing page sequence with disconnected-tools, connected-workflow, module deep-dive, controlled-automation, and use-case sections.
- Refined exposed landing copy around provable operating truth, OHADA operating-system flow, payments, evidence, and trusted books.
- Updated login/register copy so auth reads as entry into the same ledger-first OHADA operating system.
- Added payroll as a visible protected workspace card in the auth side panel.
- Preserved auth forms, validation flow, routing, and tenant-scoped behavior.

Files Changed

- app/[locale]/(home)/page.tsx
- components/auth/AuthLayout.tsx
- components/auth/auth-copy.ts
- messages/en.json
- messages/fr.json
- components/landing/operations-map.tsx
- components/landing/hero-dashboard.tsx

Verification

- Locale JSON parse check: passed.
- Focused ESLint on edited public/auth files and newly assembled landing sections: passed.

Residual Launch Risk

- Browser smoke and responsive screenshots were not completed for landing/login/register in both locales.
- Full project typecheck remains unconfirmed because npm run typecheck timed out earlier after 120 seconds.
- The worktree has unrelated pre-existing changes and long-path warnings under what-next.
- Confirm OHADA/SYSCOHADA readiness wording before external launch.
