

Act as a multidisciplinary principal review team: system architect, cyber-security architect, senior frontend engineer, UI/UX specialist, product strategist, business logic analyst, and SaaS growth advisor.

Act also as the Stoquify Referral-Worthy Execution Program Office responsible for creating, validating, installing, and documenting the specialized skill and agent suite required to execute the roadmap in:

docs/referrals/stoquify-referral-worthy-war-plan-report.md

Your mission is not to implement the product features yet. Your mission is to create the execution machinery: the Codex skills, agent briefs, status registers, validation reports, and installation evidence needed to drive the complete referral-worthy roadmap safely and systematically.

Objective

Using `docs/referrals/stoquify-referral-worthy-war-plan-report.md` as the source of truth, execute the sequence of events required to create, validate, and install the specialized skills and agents described in the roadmap.

The final result should be a working local execution suite that can guide future implementation of:

- daily business truth
- cash leakage radar
- accountant close portal
- customer/supplier statement network
- inventory loss control
- compliance readiness
- financing passport
- copilot and WhatsApp operations
- referral proof artifacts
- full roadmap orchestration

Evidence To Inspect First

Inspect these files before creating anything:

- `docs/referrals/stoquify-referral-worthy-war-plan-report.md`
- `docs/referrals/stoquify-referral-worthy-war-plan-prompt.md`
- `docs/referrals/stoquify-referral-worthy-execution-roadmap.md`
- `docs/referrals/stoquify-referral-worthy-executed-roadmap-report.md`
- `docs/referrals/referral-worthy-platform-features-report.md`
- existing local skills under `C:\Users\J COMPUTER\.codex\skills`
- any existing related skills named `aqstoqflow-*`, especially business event, POS ledger, payment reconciliation, inventory, close assurance, accountant portal, AI copilot guardrails, release verification, and module packaging skills

Do not duplicate existing skills blindly. Reuse or reference existing skills where they already cover part of the roadmap.

Required Skill Suite To Create Or Finalize

Create, validate, and install the following local skills unless an equivalent already exists:

1. `stoquify-referral-war-room-orchestrator`
2. `stoquify-daily-truth-command-center`
3. `stoquify-cash-leakage-radar`
4. `stoquify-accountant-close-portal`
5. `stoquify-statement-proof-network`
6. `stoquify-inventory-loss-control`
7. `stoquify-compliance-readiness-calendar`
8. `stoquify-financing-passport`
9. `stoquify-copilot-whatsapp-ops`
10. `stoquify-referral-proof-artifacts`

Each skill must include:

- `SKILL.md`
- clear trigger phrase
- purpose and scope
- evidence to inspect
- files/folders likely involved
- execution workflow
- expected artifacts
- verification commands
- risk controls
- success criteria
- non-goals
- handoff instructions to the next skill or phase

Agent Briefs

Create companion agent briefs for the same roadmap execution program. These may be saved as Markdown under:

`docs/referrals/agents/`

Each agent brief should define:

- role
- responsibilities
- required context
- expected outputs
- collaboration boundaries
- risk controls
- validation expectations

At minimum, create briefs for:

- Program Orchestrator Agent
- Product Strategy Agent
- Enterprise Architecture Agent
- Security/RBAC/Redaction Agent
- UI/UX Workflow Agent
- POS/Cash Control Agent
- Inventory Control Agent
- Accountant/Close Assurance Agent
- Compliance/OHADA Agent
- AI Copilot/Automation Agent
- GTM/Referral Packaging Agent

Execution Sequence

1. Inspect the roadmap report and existing skill inventory.
2. Produce a skill gap analysis.
3. Create or update the local skill folders.
4. Create agent briefs under `docs/referrals/agents/`.
5. Validate each skill using the available skill validation workflow.
6. Fix validation issues.
7. Create a roadmap execution status register under:

`what-next/referrals/REFERRAL_WAR_ROOM_STATUS.md`

8. Create a final installation and validation report under:

`docs/referrals/stoquify-referral-worthy-skill-suite-installation-report.md`

9. Also save a PDF copy of the final report in the same folder.

10. Summarize what was created, what was reused, what remains blocked, and which skill should be run first.

Validation Requirements

Run the strongest available local validation for skill artifacts. If a system skill validator exists, use it. If not, perform a manual validation checking:

- valid `SKILL.md` structure
- clear trigger
- no vague execution steps
- no overlapping duplicate responsibilities
- explicit evidence inputs
- explicit artifacts
- clear verification commands
- risk controls for RBAC, redaction, audit, service ownership, and external sharing
- non-goals that prevent premature product implementation

Guardrails

- Do not implement product features in this run.
- Do not modify unrelated application code.
- Do not overwrite existing skills without inspecting them first.
- Preserve dirty worktree safety.
- Keep all product truth service-owned.
- Do not make WhatsApp or AI copilot a source of truth.
- Require signed tokens, expiry, revocation, redaction, and audit for external sharing skills.
- Require evidence-backed workflows for accounting, payroll, inventory, compliance, and financing.
- Keep skills narrow enough that future Codex runs can execute them without drifting.

Final Deliverables

Save:

- local skill folders under `C:\Users\J COMPUTER\.codex\skills`
- agent briefs under `docs/referrals/agents/`
- status register under `what-next/referrals/REFERRAL_WAR_ROOM_STATUS.md`
- installation report as Markdown and PDF under `docs/referrals/`
- optional validation JSON or checklist under `docs/referrals/` if useful

Success Criteria

The run is successful when:

- all required skills are created or explicitly mapped to existing equivalents
- all skills pass validation or have documented blockers
- agent briefs exist for the execution program
- the status register identifies the first runnable implementation phase
- the installation report clearly explains the created suite, validation results, and next execution step
- the first recommended skill to run is `stoquify-referral-war-room-orchestrator`
