Nkambe Bakery Collection: Reader Guide and Source Register

Reader guide, H2 production programme and canonical sources

Harmonized working edition H2
8 October 2026
Nkambe, North-West Region, Cameroon

Read operating cards together with the safety controls and current cost register. Research and comparison entries remain clearly marked until their open issues are resolved.

Aggregate registers excluded from formula counts . . . 17

Edition H2 • 8 October 2026

Start here

The working booklet contains 138 recipe and component cards: 13 Module 1 breads, 103 retained handbook cards, the revised cake-doughnut card, 20 additional adaptations, and the H2 direct-dough baguette card. It includes baguettes, softer breads, buns, cakes, biscuits, fried snacks, fillings, sauces, assembled meals, frozen desserts and yogurt. Start with this volume for production trials.

The comparison volume preserves 254 historical numerical formula patterns plus 79 earlier handbook variant records. The research volume preserves 322 further recipes, collections, assemblies or recipe-bearing pages. These are record counts, not a claim that 796 distinct saleable products have been developed. Some sources overlap, and unresolved references remain on hold.

The owner’s older workbook “butter” and EDC quantities are combined as margarine in revised formulas. Milk tantalizer and improver are omitted. Original formulations are retained for traceability. True dairy butter and unidentified additives in independent publications are not silently redefined.

H2: baguette production programme

The exact scheduling source was found: S038, Staggered_Baguette_Production_Schedule.pdf, in the owner's Downloads folder. The separate H2 planning module identifies seven source candidates, explains contradictions, and supplies the new BAG-H2-01 direct-dough recipe. Existing poolish and soft baguette recipes retain their own methods. The revised programme is included in Volume 1.

The earlier 505-piece claim does not allow for handling loss or the 80-piece oven-load assumption. H2 shows the original calculation, the corrected five-batch yield, and the extra loads needed. It also explains how a conditional 505-retained-piece target differs from 505 raw dough portions.

All clock times below are local bakery planning times. Preparation starts at 02:00 and the first mix at 02:20. First packing release is 06:28; default first vehicle departure is 06:33 and retail arrival 07:03. These times are editable assumptions, not measured performance. A 45-minute cooling allowance does not by itself establish packing readiness.

Programme	Raw portions / retained illustration	Last packing release
Commissioning: 2 half loads, 90-minute starts	80 / 78	07:58
Normal: 5 full loads, 45-minute starts	400 / 390	09:28
Extended: 10 full loads, 45-minute starts	800 / 780	13:13

The 2% rejection allowance is rounded upward per batch. Actual rejects, sell-through and returns must be recorded. A nominal 300 g raw portion at 15% baking loss becomes 255 g; neither loss nor finished mass is guaranteed.

At five baguettes per tray and sixteen trays per load, a full load holds 80. Confirm the layout with shaped dough, expansion and actual oven racks. The normal programme provisionally requires two full-rack proofing positions, four circulating tray/rack sets with a fifth as contingency, two cooling/packing rack positions, separate dispatch staging and a vehicle whose usable capacity is confirmed. Rack interchangeability and measured mixer minimum/maximum loads remain checks before release. Staffing reservations cover named tasks; quality monitoring, breaks and paid shift coverage must be demonstrated in a timed trial.

If proofing takes 90 minutes, two proofing positions do not sustain the default cadence. If oven recovery takes the source's alternative 23 minutes, the default cadence also fails. Slow or stop mixing when downstream capacity is unavailable; the dough endpoint controls release.

Additional H2 files and planner use

File	Use
Nkambe_Baguette_Production_Planning_H2.pdf / .rtf / .md	Standalone scheduling chapter, editable text and technical source audit.
Nkambe_Baguette_Production_Planner_H2.xlsx	Editable ingredients, scenarios, batch clocks, resource requirements, single-vehicle dispatch, costs and commissioning log.
Nkambe_Baguette_Layouts_and_Timeline_H2.pdf	Two landscape sheets: trial tray layout and normal-programme timeline.
Nkambe_Harmonization_Change_Log_H2.csv	Source claims and H2 corrections.
Nkambe_Baguette_*_H2.csv	Portable default schedules, dispatch, source review and resource bookings.
Nkambe_Verification_Record_H2.txt	Final numerical, document and package checks, with limitations.

Start with Readme and Inputs in the production planner. Change the assumptions, then inspect Scenarios, each schedule, Dispatch and Costing. Recalculate in Excel or another compatible spreadsheet application after editing. The planner contains checked default preview values; 1,392 formulas were evaluated and compared with a separate model. This is not a native Excel compatibility test. The general recipe-register workbook retains its separate formula/recalculation instructions.

Unknown water, packaging, fuel, electricity, labour, transport and other costs are not zero. Full cost and contribution remain blank until the required inputs exist. Known ingredient subtotals are not net profit or a recommended selling price. CSV/PDF schedules and the resource-booking snapshot do not update when workbook inputs change. Generate a fresh resource plan and check actual staff, racks, proofers and vehicle conflicts before using changed assumptions.

All 137 prior working cards, historical comparisons, research entries, safety controls and original source files were preserved. H2 adds one working baguette card and four ingredient lines, giving 138 working cards, 918 ingredient rows and 796 coverage records. Coverage counts include overlapping historical evidence and are not counts of unique products. The source inventory retains 590 local filename candidates and adds one separately identified external technical reference. Every working recipe still requires trial and release evidence.

Files and editing

File / format	Purpose
Nkambe_Harmonized_Recipe_Booklet_H2.pdf	Volume 1 - Working recipes; 358 pages
Nkambe_Formula_Comparison_H2.pdf	Volume 2 - Formula comparisons; 359 pages
Nkambe_Research_Recipe_Archive_H2.pdf	Volume 3 - Research recipes; 403 pages
Nkambe_Complete_Harmonized_Collection_H2.pdf	This guide and all three volumes together. Printed page numbers restart within each volume; use the PDF bookmarks and local contents.
Nkambe_Harmonized_Recipe_Booklet_H2.rtf	Editable working booklet; opens in Word or another RTF editor.
Nkambe_Formula_Comparison_H2.rtf	Editable historical comparison.
Nkambe_Editable_Recipe_and_Costing_Registers_H2.xlsx	Prices, ingredient quantities, linked component costs, coverage, issues and sources.
H2 CSV and Markdown files	Portable editable copies of registers and all three text volumes.
Nkambe_Complete_Recipe_Package_H2.zip	All final H2 deliverables together; original source files are preserved in their original locations.

In the workbook, edit the Prices sheet, then complete measured usable yields on Summary. Ingredient formulas and prepared-component subtotals recalculate when opened in a spreadsheet application. Blank prices remain unknown. Components carry their known ingredient subtotal per usable gram; they are incomplete while any component input is unpriced. Review each component’s recipe as well as the finished assembly.

Summary has separate input cells for complete variable batch cost and selling price. Contribution is computed only when those fields and a saleable-unit count are supplied. Updating an ingredient quantity does not automatically redesign portion size, update every yield assumption or validate a process. Check those fields explicitly. Original missing-input notes and CSV values are export snapshots; they do not update with Excel edits. The linked workbook was structurally and arithmetically checked; it has not been opened in Excel for a native recalculation in this session.

Verification and practical limits

The staged search identified 590 filename candidates and 179 different file contents, plus relevant image screening. All candidates have a recorded disposition. Protected folders, long-path failures, cloud-only files and documents with unrelated filenames limit discovery. This is not a claim to have inspected every file on the computer.

Working-card ingredient sums, commercial scaling factors, price extensions, component references, historical revisions and the corrected cake-doughnut total were checked programmatically. Unknown prices were not converted to zero. The bread poolish allocation and handling-loss convention were also checked. Three aggregated ingredient-register columns were excluded from the recipe count because they combined multiple recipes or represented multipliers rather than ingredient masses.

PDF checks cover page count, extractable text and page-boundary overflow. Every working-card ID is present. The working volume was reviewed in page-contact overviews and selected pages at readable magnification; sample pages from the comparison and research volumes were also inspected. These checks are document-quality checks, not proof that every historical quantity or OCR numeral is correct. Small continuation pages can occur where a source record ends.

The retained research pages preserve original quantities and wording, including disputed methods. They are comparison evidence, not production instructions. Review the issue printed before each record; C01–C05 in the working booklet override conflicting food-safety advice. Scanned pastry recipes and household measures need image checks, weighing and process development before adoption.

No signed repeat-batch records were supplied. Full operating costs, sale prices, sale-through, shelf life, milk specifications and several equipment capabilities remain unresolved. All working formulas therefore require production trials; historical and research records are explicitly held where further specification is needed. This edition does not guarantee profitability or claim commercial validation of the complete source library.

Development and release priorities

Priority	Action / evidence
First pilot group	Choose one everyday loaf, milk bun, baguette, T01 cake doughnut and H20 chin-chin. Record three independently acceptable trials before scaling.
Ingredient identities	Check Top Milk type, Millac solids, Roma fat/salt and flour suitability; obtain missing quotes by edible or ready-to-use mass.
Facility checks	Confirm tin dimensions, mixer load limits, fryer control, retail electrical load and verified cooling capacity.
Perishable foods	Qualify meat cooling/reheat and frozen-samosa centre cook; qualify dairy treatment, chilling, culture and frozen storage.
Unique research products	Preserve exact variants in the archive. Select individually, normalize household/OCR quantities, cost and validate before moving into the working series.
Menu concepts without a full card	A menu idea or flavour name is a development gap, not an approved formula. Custom celebration/decorating formats, new beverage flavours, dietary claims and alternative pack sizes need separate specifications before sale.

Source register

Canonical sources are listed below. Exact duplicate paths and dispositions remain in Nkambe_Source_Inventory_H2.csv. The separate H2 production planner includes the scheduling-source audit.

Alphabetical recipe index **353**

Production release record **358**

Harmonized working edition H2 • 8 October 2026

Prepared for the owner and production team in Nkambe, North-West Region, Cameroon.

This booklet brings the bakery's bread, pastry, savoury-food and frozen-dessert formulas into one controlled working collection. Begin with a small group of pilot recipes, measure output and complete costs, then release only the versions that meet the agreed quality and handling requirements.

The operating cards preserve the 13 breads from Module 1, the more fully specified components and products from the previous handbook, and selected new adaptations that fill gaps in the older workbooks. The comparison volume preserves alternative formulations and the research volume records additional recipes that still need ingredient, process or transcription work. A documented formula is not a documented successful production trial. No owner batch logs establishing production validation were found.

How to use this edition

Use the recipe ID on the production sheet, stock issue, batch label and sales record. Print the entire card together with its supporting components. Select one version per product and record any deviation before mixing. Similar names can describe substantially different products: keep lean baguettes, soft baguettes, rich milk loaves, laminated pastries, cake doughnuts and yeast doughnuts separate.

The owner clarified that the older workbook entries "butter" and "EDC" mean margarine. In revised workbook formulas these quantities are combined and costed using Roma. "Milk tantalizer" and improver are omitted. Original entries remain in the comparison register as evidence of the change. This clarification is not extended to an unrelated author's EDC product or to a professional recipe explicitly requiring real dairy butter. Unidentified third-party additives remain on hold.

Milk powder is Millac Premium fat-filled powder. It cannot silently replace skim powder or whole milk powder in a frozen-dessert balance. Top Milk's purchase price is known, but its identity as sweetened condensed, evaporated or another concentrated product remains unconfirmed. Formulas requiring a particular concentrated milk stay conditional until the tin specification is checked.

All operating temperatures, times, yields and tray counts are starting points unless backed by a recorded trial. Scale ingredients, not mixing, fermentation, cooking or cooling times. Purchase prices are owner-supplied quotes, not a market-price survey. "UNPRICED" means missing information; it never means free.

Scope and evidence

The staged search covered the current workspace, Documents, Desktop, Downloads, locally accessible OneDrive and WPS locations, the user-home top level, and document filenames on accessible D and E drives. It identified 590 filename candidates and 179 different file contents before final relevance screening. Exact file duplicates were detected by content hash. Related PDF, Word and text editions were also reviewed as a single publication family where appropriate.

The large pastry scan and three short recipe PDFs were processed locally with Windows OCR. OCR wording and numerals are research evidence until checked against the page image; only selected adopted material has been visually checked. Unreadable characters, vague spoon/cup measures and unnamed ingredients are not converted into invented production weights.

Search limits: protected System Volume Information folders on D and E denied access; eleven long software snapshot paths could not be statted. System/program folders were not exhaustively content-searched. A filename-led search can miss a recipe stored under an unrelated name. Cloud-only material and external accounts are not assumed to have been read. The source register records exclusions and file-level limitations; it does not claim a forensic search of every file on the computer.

The source IDs S001–S179 belong to this project. Earlier handbooks reused S numbers for web references; those historical references are not the same numbering system. This edition cites the actual local file, sheet/cell or section through its source register. Recipe IDs such as S-B01 remain recipe IDs, not source IDs.

Selection and comparison decisions

The earlier handbook provides the operating baseline for specified savoury components, assemblies and specialist dairy recipes because it separates raw and cooked masses and supplies more complete procedures. It remains a development document. Module 1 is retained as a separate family because its owner-priced bread formulas differ from those baselines. The Melto spreadsheets remain the authority for what their historical cells contained, but their batch multipliers, partial sums, piece counts and margins are not accepted without recalculation.

Workbook comparison uses flour as the common denominator where appropriate and total mass otherwise. It preserves different ratios and quantity columns, including columns that may be scaling errors rather than deliberate recipes. Exact formula ratios occurring in several sheets are linked, not counted as independent trials. Ingredient spelling differences and explicit ingredient identities are recorded; merely sharing a product name is not a reason to average formulas.

The H-series adds fixed-mass trials for Agege bread, tangzhong milk loaf, ciabatta, whole-wheat bread, Danisa-style biscuits, Melto biscuits, milk shortbread, marble cake, genoise, chin-chin, beignets soufflés, croissants, chocolate laminated rolls, local galette bread, zebra loaf, focaccia, plantain chips, onion-cheese filling, pastry cream and granola. These changes serve portion consistency and fill actual source gaps. This is a trial library, not a recommendation to launch all products together.

Ingredient purchasing register

Ingredient	Owner purchase unit	Purchase FCFA	Normalized price	Use and remaining check
Le Choix du Boulanger flour	50 kg	21,000	420.00 FCFA/kg	Check protein, absorption and suitability for each bread/cake/biscuit
Nevada instant dry yeast	24 packs × 450 g = 10.8 kg	18,000	1,666.67 FCFA/kg	Verify strain and performance in sweet dough; keep dry and follow storage label
Roma margarine	9 kg bucket	12,000	1,333.33 FCFA/kg	Confirm fat, salt, allergens and creaming performance; not assumed to be roll-in fat
Millac Premium fat-filled powder	25 kg	80,000	3,200.00 FCFA/kg	Confirm milk solids, vegetable fat and reconstitution instructions
Top Milk concentrated milk	30 tins × 1 kg	30,000	1,000.00 FCFA/kg	Exact type and composition unresolved; price is not substitution permission
Granulated sugar	50 kg	32,000	640.00 FCFA/kg	Icing sugar remains a separate unpriced ingredient
Salt	18 kg	3,500	194.44 FCFA/kg	Food-grade fine salt; full precision used in calculations
Cooking oil	20 L	26,000	1,300.00 FCFA/L	At provisional 0.92 kg/L: 1,413.04 FCFA/kg; verify brand, frying suitability and net mass

Missing quotes include eggs by edible mass, drinking water, butter, specific dairy products, meat, fish, vegetables, fruit, cocoa/chocolate, nuts, spices, cultures, stabilizers, packaging and process consumables. Obtain supplier specifications along with prices. Do not inherit historical egg-carton weights or older milk prices as current facts.

For eggs bought by count, weigh a representative sample without shells. Edible-egg price per kg = carton cost divided by measured edible kg. For produce and meat, choose either a purchased-raw basis with measured preparation loss or a ready-to-use basis, and apply it consistently. Avoid charging peeling or cooking loss twice.

Facility and capacity rules

Facility A starts around 02:00 and performs mixing, baking, meat cooking, fillings, sauces and liquid preparations. The reported 16-tray diesel rotary oven has working steam injection and 60 × 40 cm trays. Tin dimensions, rack clearance, loaded temperature recovery and tray spacing still require checks. Use the oven's approved steam controls; do not throw water into a hot diesel oven.

The spiral mixer is described as having a 50 kg flour capacity. Confirm maximum finished-dough mass, minimum load, hydration limits and duty cycle; a 50 kg flour label is not automatic approval for any enriched 90 kg dough. Pilot quantities below the minimum require appropriate small equipment or hand mixing. Cakes, creamed biscuits and foams need a paddle/whisk; a dough spiral and a slow cooking scraper cannot be assumed to perform those functions.

Two proofers, induction frying equipment and a mixing/cooking pot are reported. Verify their controls and hygienic design. No assumption is made that the pot is a qualified dairy pasteurizer, that a refrigerator can rapidly chill a bulk hot batch, or that a holding freezer has adequate hardening capacity.

Facility B receives finished products and controlled-temperature components, then assembles, reheats, fries small samosa batches and freezes/dispenses approved liquid mixes. Samosas are prepared and frozen at A, kept frozen during transfer and storage, then fried to order using a validated frozen-piece process. Shawarma meat is cooked at A; the decorative machine does not justify leaving meat outside temperature control.

Owner-reported A power is a 20 kW inverter, 30 kWh nominal battery and 25 kW diesel generator. Retail induction is described as about 2.5 kW, with per-burner versus combined meaning unresolved. Plan one burner at a time until measured electrical limits permit more. Older claims of different retail inverter capacity are not treated as current confirmation. Protect refrigeration and qualified cooling before adding production load. Solar energy is unavailable at the 02:00 start and is not a reason to price all energy at zero.

C01 General food safety and two site controls

Use potable water, approved suppliers, cleanable equipment and separate raw-meat and ready-to-eat tools. Check ingredient lots, expiry, damaged tins and cold-chain history. Wash hands appropriately; gloves do not replace hand hygiene. Clean and sanitize using the chemical label's concentration, contact time and rinsing instructions. Prevent allergen cross-contact and carry component allergens onto the finished-product label.

House operating targets for cooked meat, poultry, fish and egg dishes are at least 75°C for 30 seconds in the coldest representative centre; hot holding at least 63°C; chilled storage at 4°C or below. These are external technical guidance and internal targets, not claims about Cameroonian statutory limits. Validate the probe location, batch thickness and repeatability. Reheat rapidly under a written process and verify the same house endpoint; never use hot holding to slowly warm a cold batch. UK government cooking guidance

For cooked perishable food, verify cooling from 57°C to 21°C within two hours and to 5°C or below within six hours total; this bakery's final cold-storage target is 4°C. Use shallow portions, ice baths or qualified rapid-cooling equipment and log the slowest cooling point. The two hours are part of the six, not additional. Failed or unknown histories require segregation and disposition under the site procedure; smell is not evidence of safety. FDA Food Code 2026, section 3-501.14, PDF pages 98–99

At dispatch and receipt record lot, time, food temperature, container condition and receiver. Use clean covered containers and qualified hot/chilled/frozen transport. Keep frozen products at a working target of −18°C or below and prevent thaw/refreeze cycles; check each machine's instructions and local requirements. An outage response must preserve food-temperature evidence and identify suspect lots. Do not reset the shelf-life clock after transfer or reheating.

C02 Dairy mix and frozen desserts

Every dairy base needs a specified, validated treatment system. Reconstituted powder is not sterile. The University of Guelph describes batch ice-cream pasteurization at at least 69°C for 30 minutes in appropriate equipment. Use this as a technical reference for a qualified process, not permission to heat an unverified pot for an approximate interval. Establish agitation, the cold point, instrument accuracy, treatment hold and rapid chilling to 4°C or below. If equipment cannot demonstrate these controls, use a suitable approved commercial mix. University of Guelph pasteurization guidance

Follow the actual stabilizer/emulsifier technical sheet. Generic CMC, guar, xanthan, starch and proprietary blends are not interchangeable gram for gram. Hold any formula with an unidentified additive, unspecified “others,” or an unverified dose. Mixing or whipping does not replace pasteurization or pressure homogenization. A milk-containing “sorbet” is not dairy-free. Renaming a product does not change its allergens.

Age mixes cold only within the qualified schedule; apply the manufacturer’s sanitation, hopper-temperature, minimum-fill and overnight rules. Never top fresh mix onto an uncontrolled old batch. Measure mix and dispensed product mass. Overrun changes volume, not ingredient mass: overrun = (mass of equal-volume mix / mass of equal-volume frozen product − 1) × 100. A 1 kg formulation pilot may be too small to charge a machine safely.

C03 Fruit drinks and fruit ices

Freezing, lemon juice, ginger and bissap acidity do not by themselves make a contaminated mixture safe. Use qualified ready-to-eat fruit preparations or a validated treatment for the finished product; additions after heating can recontaminate it. Treat juice and purée recipes as perishable until their process, pH, soluble solids, packaging and storage have been evaluated. Use a calibrated pH meter and refractometer where specified; neither replaces microbiological/process validation. No ambient bottled-juice or hot-fill process is established by this booklet.

Set sweetness by measured fruit solids and a recorded small trial, not an unlogged “add sugar to taste” instruction. Do not automatically replace pineapple, banana, mango, coconut and milk by equal volumes. They contribute different sugar, fibre, acid and fat. Record actual batch mass and mould-fill mass; litres of water plus kilograms of solids do not necessarily equal the claimed final litres.

C04 Cultured yogurt

Use an identified food-production starter with the actual supplier dose and instructions. Do not use chilli stems, spontaneous souring, an unidentified stock yogurt or an indefinitely recycled culture as the production culture. Older documents containing those practices are retained only for comparison and are not approved procedures.

As a technical reference, Tetra Pak describes yogurt milk treatment at 90–95°C for about five minutes, inoculation around the culture’s specified temperature, fermentation to about pH 4.5 and prompt cooling. Verify the chosen powder’s composition and the culture’s temperature/dose rather than transferring one supplier’s units to another. Record the fermentation curve and a validated maximum time; failed acidification requires segregation. Tetra Pak fermented milk guidance

Cool using a validated process to the house 4°C storage target. Post-fermentation fruit, sugar solutions and flavours must be suitable for ready-to-eat addition. A longer fermentation, more stabilizer or preservative is not a substitute for hygiene or refrigeration. No two-week, thirty-day or ambient yogurt life is established here.

C05 Release and shelf life

Use same-production-day quality policy for plain breads and simple snacks during initial trials. Perishable fillings, sauces and desserts require a written chilled/frozen life decision before commercial sale, based on the formulation, treatment, packaging, actual temperature history and appropriate testing. Trial checkpoints at several ages are observations, not an approved selling period. Supplier use-by limits remain applicable. Confirm permits, labeling and applicable product requirements with the relevant Cameroonian authorities; international references here do not establish local legal compliance.

Costing method and commercial decisions

For each ingredient, extended cost = input grams / 1,000 × confirmed FCFA/kg. The cost audit shows known amounts and unresolved inputs separately. Prepared components carry their ingredient cost per usable gram into an assembly once. Do not charge both the component and all its raw ingredients again to the finished product. The same rule applies to labour and energy already included in a component's full variable cost.

Complete batch variable cost = ingredients + allocated process consumables/oil loss + packaging + variable labour + metered or defensibly allocated energy + variable transport + commissions + other variable expenses. Divide by saleable units after rejects, samples and unsold waste, using the chosen time period consistently. Contribution = selling price less full variable cost. Net profit also deducts fixed expenses; these are different measures.

An illustration only: if a batch's complete variable cost is 12,000 FCFA and 100 units sell, variable cost is 120 FCFA/unit. At a hypothetical 200 FCFA price, contribution is 80 FCFA/unit and 8,000 FCFA per batch. If only 80 units sell and all 12,000 FCFA remains incurred, cost per sold unit is 150 FCFA and batch contribution is 4,000 FCFA. These are arithmetic scenarios, not a forecast for Nkambe.

At the same hypothetical 80 FCFA contribution per unit, 240,000 FCFA monthly fixed expenses would require 3,000 sold units merely to cover those fixed expenses, before any other excluded costs. Use this relationship only after recording actual price, sell-through and complete cost. Do not accept the older spreadsheets' automatic 16% deduction as a substitute for actual operating expenses.

For bread, track loaf/roll count per kg flour, measured bake loss, saleable yield, rejects, returns and contribution per oven-tray minute. For samosas, track frozen-piece rejects, centre-temperature performance, oil use and customer wait. For frozen desserts, track mix lost during cleaning, overrun, power and usable portions. The best-looking ingredient margin can be inferior after slow service, unsold stock or cold-chain losses.

Purchasing and first pilot sequence

Begin with M1-B01 or S-B02 for the everyday loaf, one milk bun, one baguette, T01 cake doughnuts and H10 chin-chin. Trial these on separate identified batches before choosing a permanent formula. Add O-P18 samosas and a single shawarma assembly only after cooling, transport and reheating/frying have been demonstrated. Release frozen dairy and yogurt only after their equipment and process gates are met. Customer demand and willingness to pay remain hypotheses to test locally.

Create the purchase list from the selected recipes' commercial quantities, then add measured preparation yield and a controlled stock buffer. Do not purchase ingredients for the entire library at once. Consolidate identical ingredients and count components at the lowest raw-material level once. Order allergens and perishable materials in volumes compatible with segregation and safe storage.

Initial pilot activity	Suggested window from 02:00	Release observation
Opening sanitation, lot checks and instruments	02:00–02:20	Cold stores and probes acceptable; power plan confirmed
First bread dough	From 02:20	Dough temperature, consistency, mixer load and recipe ID recorded
Bulk fermentation, division and proof	Recipe dependent	Use expansion endpoints; stagger a second mix only when bench/proofer capacity allows
Baking and protected cooling	Recipe dependent	Rack colour and centre set checked; cooled weights recorded
Savoury cooking and active cooling	Separate controlled work block	Raw-to-ready-to-eat segregation and cooling logs complete
Dispatch	After release, not a fixed promise	Packaged count, lot and food-temperature handover
Retail finishing	In response to demand	Small loads, measured fryer recovery and safe centre endpoint

Version history and unresolved decisions

Version	Change	Evidence status
Earlier local manuals and workbooks	Historical recipes and concepts	Related generated editions and source records; no independent production validation inferred
Module 1 v0.2	Thirteen bread formulas with owner purchase prices	Retained in M1 series; full operating expenses still incomplete
H2	Adds BAG-H2-01 and three corrected baguette production scenarios; H1 recipe library preserved	Timed trials and full costs outstanding
Harmonized H1	Cross-source comparison, current costs, margarine clarification, removal of two additives, selected adaptations and research holds	Working edition requiring practical release trials

Critical open items are Top Milk’s type; flour and fat specifications; Nevada suitability in sweet dough; tin dimensions; mixer limits; dairy treatment and rapid cooling; freezer and machine capacity; culture/stabilizer identities; oil density and actual uptake; ingredient quotes; complete operating costs; product life and sale prices. The detailed issue and recipe registers identify where each matters.

Baguette Production Planning and Daily Capacity

H2 planning module • 8 October 2026 • Nkambe, Cameroon • All clock times are local bakery planning times.

Decision and source identification

The requested document was located: **Staggered_Baguette_Production_Schedule.pdf**, source S038, in the owner's Downloads folder. It has two pages and was modified on 11 September 2026. Its filename describes scheduling; its internal heading is “Commercial Baguette Production Guide”. This is the closest direct match, supported by the five-batch programmes in S026 and S027. Current file hashes match the H1 source inventory.

S038 describes two 80-piece batches. S026/S027 extend related reasoning to five batches of allegedly 101 pieces each, implying 505 pieces in a production campaign. That is a source claim, not a verified daily output. No sales orders, successful timed campaign, installed rack count or signed production record were supplied.

H2 retains the useful idea of staggered mixing and converts it into whole-load programmes. It does not adopt the source's contradictory clocks, unverified equipment claims or immediate closed-box packing. The new recipe BAG-H2-01 is a separate direct-dough commercial trial; existing M1-B12, M1-B13 and S-B01 remain separate formulas.

Source	Relevant evidence	Decision
S038	PDF p1 formulation/cadence; p2 two-rack timeline and controls	Primary requested scheduling document; correct arithmetic and sequencing
S030	PDF pp1–2; 80-piece formula and industrial workflow	Formula/process companion; contains the same yield discrepancy
S027	PDF pp1–2; five-batch checklist, 18 kg flour and 101 pieces/batch	Retain implied 505-piece target as historical; rack and timing claims rejected
S026	Lines 9–29 schedule; 33–70 staff/logistics; subsequent water/ice discussion	Useful duty and distribution concepts; reject hot airtight packing and unqualified par-bake route
S001	PDF p1 audit and section 4 baguette system	Earlier corrections are supporting analysis, not a production test
S131 / S137	Equipment sections and two-site business plans	Broad operating context; not the requested baguette-specific programme

Source audit and corrected calculations

Topic	Original claim / input	H2 correction
Ingredient total	S038 lists flour 14.20 kg, water 9.37 kg, salt 284 g, yeast 71 g.	Sum = 23.925 kg. At exactly 66% water, water would be 9.372 kg and total 23.927 kg. Neither is 24 kg.
Whole pieces	S038 says the batch yields exactly 80 × 300 g.	23,925 / 300 = 79 pieces and 225 g left before handling loss. With 1% handling loss: 23,685.75 g → 78 pieces and 285.75 g left.
Cooled weight	300 g raw is described as 250 g at 15% bake loss.	300 × 0.85 = 255 g. A mathematical 250 g target at 15% loss requires 294.118 g raw, before portion and process variation.
18 kg flour variant	S027 uses 18 kg flour, 8.28 kg water, 3.6 kg ice, 360 g salt, 90 g yeast.	Total 30.330 kg, hydration 66% including ice. Before handling loss: 101 pieces + 30 g. At 1% loss: 100 pieces + 26.7 g.
Five-batch output	Five batches are claimed to yield 505 baguettes.	With 1% handling loss and 300 g portions, five 18 kg-flour batches give 500 pieces before rejects. At 80/load, 7 pooled loads are needed; if every batch is kept separate, 10 loads (80+20 per batch). Proofing must be redesigned for either route.
Rack geometry	101 pieces are treated like one 16-tray load.	16 × 5 = 80. 101 requires at least 21 trays at 5/tray. It cannot fit the assumed one-load geometry.
Proof window	S038 p2 starts batch 1 proof at elapsed 01:30, promises 60 min, but loads at 02:15.	That window is 45 min. Batch 2 proof 02:15–03:15 is 60 min. H2 uses a common explicit 60-minute planning slot, subject to dough endpoint.
Remaining times	At 00:45, S038 says batch 1 has 27 min left in bulk; its bulk actually ends 01:03.	18 min remain. Several remaining-time and overlap annotations disagree with their own start/end times.
Cadence	S038 calls the oven cycle 25 min, prescribes 45-minute mixing starts, then shows first/second oven starts 60 min apart.	These are three different intervals. H2 reserves 40 minutes for scoring/loading, baking, unloading and recovery; 45-minute starts leave 5 minutes of nominal slack.
Recovery	S038 alternates 3-minute recovery and a mandatory 23-minute thermal recovery statement.	Neither is a measured requirement. Time actual recovery; H2 provisionally reserves 5 min after unloading. If 23 min is actually required, the H2 45-min cadence fails.
Mix rest	A 10-minute rest with yeast already included is labelled autolyse.	H2 calls it a hydrated-dough rest. A flour/water-only autolyse is a different method and must not be inserted as extra time without revising the schedule.
Dispatch	Some related manuals seal hot bread immediately and assume a 23-minute delivery.	Cool in a protected ventilated area; validate packing readiness. H2 uses explicit cooling, packing, vehicle loading, travel, handover and return assumptions.
Retail bake	S026 offers a 15-minute par-bake option.	This edition schedules full baking at A. A qualified second bake, cooling/storage process and suitable B oven have not been established.

BAG-H2-01 Direct-dough commercial baguette

Status: harmonized source adaptation, version H2, production trials required. Sources: S038 pp1–2, S030 pp1–2 and S027 pp1–2. Intended result: a lean, crisp-crusted, roughly 48–50 cm commercial baguette, with an evenly expanded crumb and consistent raw portion. It is not a claim to a protected French designation or to a guaranteed finished retail weight.

Retain the source's nominal flour 100%, water 66%, salt 2% and instant yeast 0.5%. Scale to the required portions and allow 1% handling loss. Round flour upward to a whole gram, water to a gram, and salt/yeast to 0.1 g; recheck the resulting total. This avoids promising an additional whole piece from a rounded-down batch. The 40-piece pilot needs a suitably sized mixer; it is not automatically a permissible minimum load for the large spiral.

Ingredient / specification	Baker %	Pilot 40 pieces, g	One load 80 pieces, g
Le Choix du Boulanger flour; absorption/protein to verify	100	7,194	14,388
Potable chilled water; ice included within this total	66	4,748	9,496
Fine food-grade salt	2	143.9	287.8
Nevada instant dry yeast	0.5	36.0	71.9
Total weighed input	168.5 nominal	12,121.9	24,243.7

Mass/yield measure	40-piece pilot	80-piece load
Input g	12,121.90	24,243.70
After 1% handling loss, g	12,000.68	24,001.26
Raw pieces × 300 g	40 × 300 = 12,000	80 × 300 = 24,000
Unallocated dough after handling, g	0.68	1.26
Bake loss illustration	15%; 255 g cooled per piece	15%; 255 g cooled per piece
Before-reject cooled mass, kg	10.200	20.400
Reject allowance: ceil(pieces × 2%)	1 piece; 39 retained	2 pieces; 78 retained
Retained saleable mass illustration, kg	9.945	19.890

“Retained saleable” is a planning allowance, not a measured result or an order forecast. Rounding rejects upward makes the effective allowance 2.5% in these examples. Unsold stock is a separate commercial loss and is not silently included in this allowance. Record leftovers and their disposition; no extra loaf or unpriced rework is assumed.

At 13–17% bake loss a 300 g portion finishes around 261–249 g. Therefore this plan does not establish a guaranteed 250 g net weight. Measure cooled weights and their variation before choosing a declared weight. If a particular minimum is required, design the portion allowance from actual worst-case process data and applicable requirements.

Numbered process and observable endpoints

1. Before mixing, verify ingredient lots, clean scales, water supply, tray/rack fit, guards and steam controls. Record room, flour and water temperatures. Do not taste raw flour or dough. Prepare batch labels and weigh all ingredients separately; no improver, Milk tantalizer, milk, margarine or sugar belongs in BAG-H2-01.

2. Start with most of the listed water, flour and yeast, mix gently for about 3 minutes, rest the hydrated dough for 10 minutes, then add salt and the balance of the listed water and mix about 5 minutes to moderate development. The 18-minute slot is a trial. Target source-derived final dough temperature 23–24°C; adjust water temperature from measured friction and ambient conditions. Do not automatically use 4°C water or a fixed ice percentage in every season. All ice must be food-grade, melt by the end of mixing and replace an equal mass of listed water.

3. Transfer into a covered food-grade bulk bin. Allow a provisional 45-minute bulk fermentation. Require visible fermentation and extensibility, not a timer alone. At 0.5% instant yeast and this dough temperature, actual required time may be longer. Record the result; if the baseline under-ferments, extend bulk/proof and rerun the resource model rather than increasing yeast ad hoc.

4. Divide and preshape in a 15-minute planning slot, checking pieces against 300 g. Keep pieces in numbered first-in/first-out order. The next 15-minute slot moulds those same pieces in the same order: at an even rate each piece has approximately 15

minutes between preshape and moulding. That rest overlaps division of later pieces; do not insert another full-batch 15 minutes unless the schedule is revised. Irregular work rates require timed subgroups and a new slot allowance.

5. Mould gently, using verified roller settings and minimal measured dusting flour. Trial 48–50 cm lengths. Place seam-down, five per 60 × 40 cm tray only if the finished width and airflow test pass. Dusting flour is an additional process quantity to weigh and cost; the dough formula does not include an unlimited dusting allowance.

6. Load a verified proofer bay. Plan 60 minutes from the last tray loaded, near 26°C and 75–80% relative humidity if the installed controls can maintain it. The first formed pieces begin expanding earlier. Check tray-to-tray consistency; a slowly recovering light indentation and expanded, aerated dough are guides. Bake at the appropriate endpoint. The schedule includes a further 10-minute scoring/loading slot; dough must tolerate that actual elapsed time. Record proof exit and oven entry separately.

7. Preheat using the oven manual and a measured lead time. A trial starting point inherited from the source is 240°C preheat, about 220°C baking and 22 minutes for this size. Commission a steam programme through the working injection system; the source's 15–20-second pulse is not a universal setting. Score before loading, following the shaping style and a blade-handling procedure. Never throw water into the diesel oven or improvise the steam plumbing. Use the manufacturer's damper procedure to finish the crust.

8. Check even colour, expansion and fully set crumb using cooled cut samples as well as the established bake controls. Unload with appropriate heat protection. Log recovery to the next qualified loading condition, rather than assuming the thermostat display proves recovery. Reserve 3 minutes to unload and 5 minutes to recover in the model; replace these with measurements.

9. Cool protected on racks. The 45-minute allowance is a trial, not automatic packing release. Check that packaging causes no condensation and the crust specification is acceptable. Pack in clean food-grade paper or the qualified pack; use protected ventilated transport crates. Do not tightly seal steaming bread, reuse raw-food containers or place bread directly against vehicle surfaces.

10. Release by lot and measured count, then dispatch to B. Check transport hygiene, quantities, time and condition at handover. Plan same-production-day quality review under C05; no multi-day shelf life is established. Retail replenishment follows actual sales and available display space. Segregate underbaked, damaged or otherwise rejected pieces; record any food-safe alternative use as a separate authorised product, not hidden yield.

Allergens: wheat/gluten; review flour processing aids, yeast and shared-equipment labels for additional allergens or cross-contact. No allergen-free claim is made. C01 and C05 remain applicable; filled baguettes additionally require the relevant meat, egg, dairy and sauce controls.

Cost audit and labour distinction

Input	One-load amount	Confirmed rate	Known FCFA
Flour	14.388 kg	420/kg	6,042.96
Salt	0.2878 kg	194.44/kg	55.96
Nevada yeast	0.0719 kg	1,666.67/kg	119.83
Water	9.496 kg	UNPRICED	UNPRICED
Known ingredient subtotal	80 raw / 78 retained units	Incomplete	6,218.75

The known subtotal is 79.73 FCFA per planned retained unit. It excludes water, dusting flour, consumables, packaging, energy, paid labour, transport and unsold stock. No complete margin or selling-price recommendation follows from it. A 10% increase in currently priced inputs adds 7.97 FCFA per retained unit; 10% fewer sold units increases the same batch-cost allocation by 11.11% before whole-unit rounding.

Reserve 35 staff-minutes per batch for M1 preweighing, mixer supervision, transfer and cleaning; 20 for D2 division/bench cleaning; 20 for F3 moulding/loading/bench cleaning; 13 active minutes for O4 score/load and unload; and 25 for P5 packing and tray-set cleanup. This gives about 113 allocated staff-minutes per batch before opening/closing, quality monitoring, relief, walking, transport or paid waiting. It includes the supervised dough-rest interval and is not a measured stopwatch

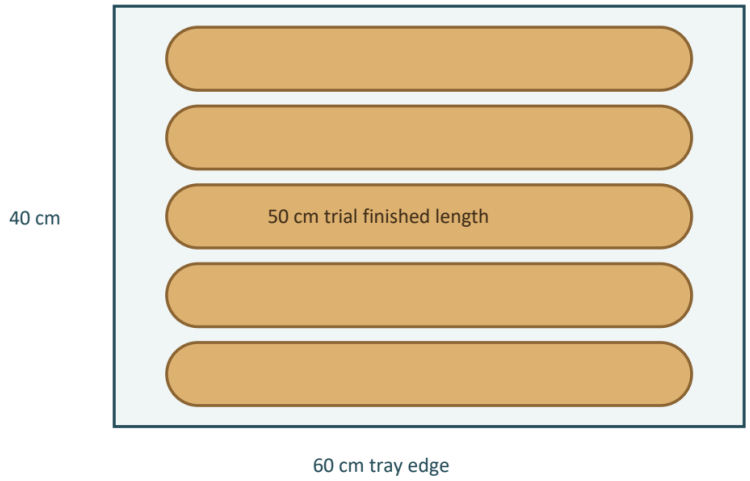

labour standard. Record hands-on labour separately. Cost actual paid staffed hours, including coverage and waiting; do not multiply 113 minutes by a wage and call it full campaign labour cost.

The model's first-batch elapsed time from mixing start to packing release is 248 minutes, plus opening checks before mixing. Active labour and elapsed process time are different quantities. The staffing allocation is intentionally generous for a commissioning bakery and can be redesigned only after timed trials.

Tray layout, rack count and capacity gates

Trial layout: orient baguette length along the 60 cm tray edge. Five pieces at up to 6 cm finished width occupy five parallel lanes across the 40 cm edge: centres at about 5, 12.5, 20, 27.5 and 35 cm. A 50 cm finished length leaves 5 cm at each end; 6 cm width leaves 2 cm outer margins and 1.5 cm inter-piece gaps. These are geometric trial allowances, not proof of adequate airflow, pan-channel fit or final expansion. Check the actual usable surface inside rims. If loaves spread wider, use four per tray and replan quantities.

Five baguettes per 60 × 40 cm tray — proposed fit test

Five lanes; trial finished width up to 6 cm. Check usable rims, expansion and airflow.
16 usable trays × 5 pieces = 80 per load. If only four pieces fit, replan for 64 per load.

The accompanying tray-layout diagram is schematic. The full 16-tray test must check all levels, colour, clearance, steam distribution and rack weight. The partial commissioning load uses 8 trays × 5 pieces, spread according to the oven manual; do not claim half the baking time because the load is halved.

Constraint	H2 baseline requirement	What changes the plan
Mixer	80-piece batch 24.244 kg dough, 14.388 kg flour	Verify minimum/maximum dough mass and duty cycle; the reported 50 kg flour description is not a confirmed bowl or dough rating
Moulding / division	Two separate work surfaces/operators; 80 pieces in each 15-minute stage	Slower actual throughput increases stage slots; revise rest and proof age

Constraint	H2 baseline requirement	What changes the plan
Proofers	Two independently usable bays, each holding one full 16-tray rack	60 min proof + 5 min bay turnover at 45 min starts needs two bays. At 90 min proof, two bays require cadence at least 47.5 min: trial 50 min, then recheck all stages
Oven	10 min score/load + 22 bake + 3 unload + 5 recovery = 40 min reservation	45 min starts leave 5 min nominal slack. A measured 23 min recovery makes reservation 58 min and requires a slower programme
Rack/tray sets	Four active sets in steady operation; a fifth full set provides contingency	A set is occupied from mould/loading through proof, bake, cool, pack and 10-min cleanup: 180 min. At 45-min starts, four sets are the calculated minimum; five sets = 80 trays, ownership unconfirmed
Cooling/packing space	Two full-load equivalent positions for cooling/packing overlap	Keep a separate dispatch staging area sized to the delivery waves; do not borrow proofer space
Vehicle	One vehicle, assumed 85-minute loaded-to-ready round trip	5 load + 30 outward + 15 handover + 30 return + 5 clean/check. Driver and vehicle cannot be sent on two overlapping trips
Power and fuel	Measured connected electrical loads, priority cold stores and oven diesel consumption	20 kW inverter, 30 kWh nominal storage and 25 kW generator are reported; usable energy, electrical phase, surges and diesel litres/hour remain open

Rack sets are not the same as the oven's one-rack capacity. A rack occupied by cooling bread cannot simultaneously carry the next proofed load. The fifth contingency set is a planning provision, not a finding that the bakery owns five racks. No purchase has been made or assumed.

At five pieces/tray the nominal oven-only rate is 80 × 60 / 40 = 120 pieces/hour. The planned 45-minute production cadence is 106.67 pieces/hour once the pipeline is filled. Neither rate applies from 02:00: the first-batch lead time, opening work, cooling, dispatch and end-of-shift cleaning remain. With only four pieces/tray, each load becomes 64; five/ten loads become 320/640 raw pieces before rejects if all other stage times still pass.

If 505 is an actual sales requirement rather than the historical raw-output claim, distinguish the two. Seven full 80-piece loads give 560 raw and 546 retained pieces under the stated reject model. A calculated alternative is six full loads plus a separately scaled 38-piece last load: 6 × 78 + (38 − 1 reject) = 505 retained pieces from 518 raw. That mixed-load option needs its own last-batch weighing and partial-rack test; it is not a fourth released programme or a recommendation to manufacture unsold surplus.

Chronological production scenarios

All scenarios begin opening checks at 02:00 and first mixing at 02:20. Times are planning outputs; they are not proof that dough will be ready on those clocks. The 800-piece case extends the campaign at the same cadence; it does not claim faster fermentation or an unproven faster oven.

Programme	Loads and cadence	Raw / retained pieces	Final pack release
PLAN-BAG-P	2 × 40; 90 min	80 / 78	07:58
PLAN-BAG-N	5 × 80; 45 min	400 / 390	09:28
PLAN-BAG-H	10 × 80; 45 min	800 / 780	13:13

PLAN-BAG-P Commissioning programme

Batch	Mix	Bulk	Divide → mould	Proof bay / proof	Score/load → bake out
1	02:20–02:38	02:38–03:23	03:23–03:38 → 03:38–03:53	1: 03:53–04:53	04:53 → 05:25
2	03:50–04:08	04:08–04:53	04:53–05:08 → 05:08–05:23	2: 05:23–06:23	06:23 → 06:55

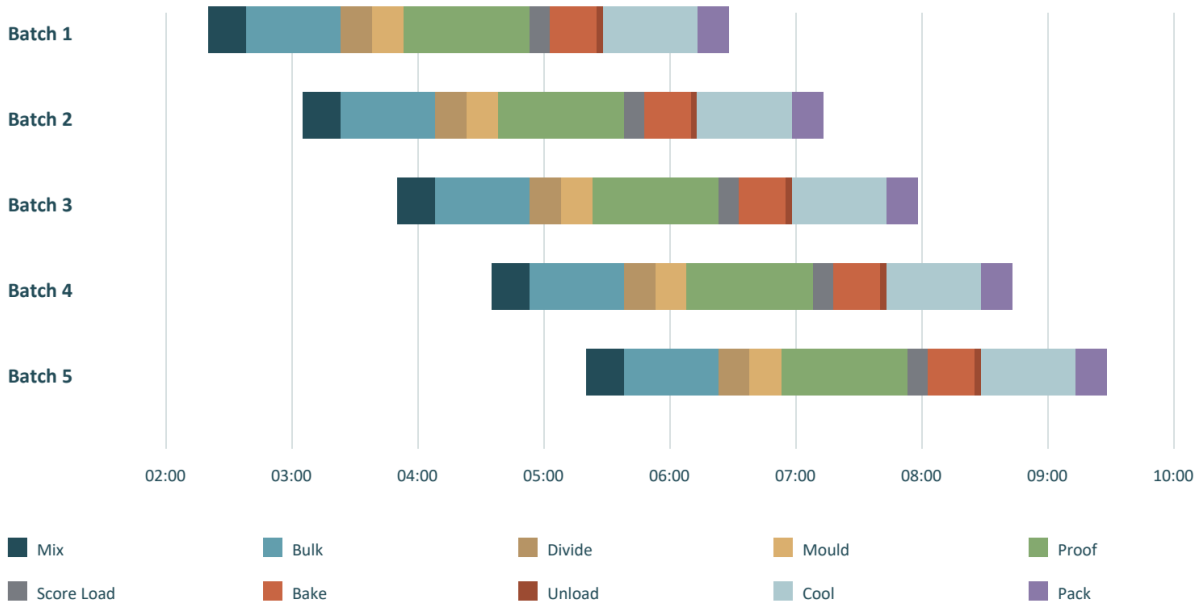

Batch	Unload / recover done	Cooling	Packing / lot release	Rack free after clean
1	05:28 / 05:33	05:28–06:13	06:13–06:28	06:38
2	06:58 / 07:03	06:58–07:43	07:43–07:58	08:08

Delivery wave	Batches / retained units	Load → depart	Arrival at B	Vehicle ready back at A
1	1 / 39	06:28 → 06:33	07:03	07:53
2	2 / 39	07:58 → 08:03	08:33	09:23

Calculated simultaneous requirements for this finite campaign: 1 proofer bays; 2 active rack/tray sets; 1 full-load equivalent cooling/packing positions. Maximum packed staging wait before vehicle loading is 0 minutes. These waits affect crust quality and sales freshness and must be tested.

Commissioning is a learning run. Use a verified small mixer or an approved large-mixer load. Check the partial rack, portion consistency and process endpoints before increasing to 80 pieces per load. Retained-unit figures do not authorize sale of an unsuccessful trial.

Normal programme: five 80-piece loads, 45 minutes apart

First mix 02:20; final packing release 09:28. Local bakery time; all durations provisional.

The higher-output case adds five loads at the same cadence. Dispatch uses a separate vehicle schedule.

PLAN-BAG-N Proposed normal programme

Batch	Mix	Bulk	Divide → mould	Proof bay / proof	Score/load → bake out
1	02:20–02:38	02:38–03:23	03:23–03:38 → 03:38–03:53	1: 03:53–04:53	04:53 → 05:25
2	03:05–03:23	03:23–04:08	04:08–04:23 → 04:23–04:38	2: 04:38–05:38	05:38 → 06:10
3	03:50–04:08	04:08–04:53	04:53–05:08 → 05:08–05:23	1: 05:23–06:23	06:23 → 06:55
4	04:35–04:53	04:53–05:38	05:38–05:53 → 05:53–06:08	2: 06:08–07:08	07:08 → 07:40
5	05:20–05:38	05:38–06:23	06:23–06:38 → 06:38–06:53	1: 06:53–07:53	07:53 → 08:25

Batch	Unload / recover done	Cooling	Packing / lot release	Rack free after clean
1	05:28 / 05:33	05:28–06:13	06:13–06:28	06:38
2	06:13 / 06:18	06:13–06:58	06:58–07:13	07:23
3	06:58 / 07:03	06:58–07:43	07:43–07:58	08:08
4	07:43 / 07:48	07:43–08:28	08:28–08:43	08:53
5	08:28 / 08:33	08:28–09:13	09:13–09:28	09:38

Delivery wave	Batches / retained units	Load → depart	Arrival at B	Vehicle ready back at A
1	1 / 78	06:28 → 06:33	07:03	07:53
2	2,3 / 156	07:58 → 08:03	08:33	09:23
3	4,5 / 156	09:28 → 09:33	10:03	10:53

Calculated simultaneous requirements for this finite campaign: 2 proofer bays; 4 active rack/tray sets; 2 full-load equivalent cooling/packing positions. Maximum packed staging wait before vehicle loading is 45 minutes. These waits affect crust quality and sales freshness and must be tested.

This replaces the historical five-mix/505-piece claim with five deliberately matched 80-piece loads. It requires confirmed rack sets, two proof bays, five production roles and an independent delivery driver. Do not combine the old 18 kg flour charge with this one-load schedule.

PLAN-BAG-H Higher-output extended programme

Batch	Mix	Bulk	Divide → mould	Proof bay / proof	Score/load → bake out
1	02:20–02:38	02:38–03:23	03:23–03:38 → 03:38–03:53	1: 03:53–04:53	04:53 → 05:25
2	03:05–03:23	03:23–04:08	04:08–04:23 → 04:23–04:38	2: 04:38–05:38	05:38 → 06:10
3	03:50–04:08	04:08–04:53	04:53–05:08 → 05:08–05:23	1: 05:23–06:23	06:23 → 06:55
4	04:35–04:53	04:53–05:38	05:38–05:53 → 05:53–06:08	2: 06:08–07:08	07:08 → 07:40
5	05:20–05:38	05:38–06:23	06:23–06:38 → 06:38–06:53	1: 06:53–07:53	07:53 → 08:25

10	09:05–09:23	09:23–10:08	10:08–10:23 → 10:23–10:38	2: 10:38–11:38	11:38 → 12:10

Batch	Unload / recover done	Cooling	Packing / lot release	Rack free after clean
1	05:28 / 05:33	05:28–06:13	06:13–06:28	06:38
2	06:13 / 06:18	06:13–06:58	06:58–07:13	07:23
3	06:58 / 07:03	06:58–07:43	07:43–07:58	08:08
4	07:43 / 07:48	07:43–08:28	08:28–08:43	08:53
5	08:28 / 08:33	08:28–09:13	09:13–09:28	09:38
6	09:13 / 09:18	09:13–09:58	09:58–10:13	10:23
7	09:58 / 10:03	09:58–10:43	10:43–10:58	11:08
8	10:43 / 10:48	10:43–11:28	11:28–11:43	11:53
9	11:28 / 11:33	11:28–12:13	12:13–12:28	12:38
10	12:13 / 12:18	12:13–12:58	12:58–13:13	13:23

Delivery wave	Batches / retained units	Load → depart	Arrival at B	Vehicle ready back at A
1	1 / 78	06:28 → 06:33	07:03	07:53
2	2,3 / 156	07:58 → 08:03	08:33	09:23
3	4,5 / 156	09:28 → 09:33	10:03	10:53
4	6,7 / 156	10:58 → 11:03	11:33	12:23

Delivery wave	Batches / retained units	Load → depart	Arrival at B	Vehicle ready back at A
5	8,9 / 156	12:28 → 12:33	13:03	13:53
6	10 / 78	13:53 → 13:58	14:28	15:18

Calculated simultaneous requirements for this finite campaign: 2 proofer bays; 4 active rack/tray sets; 2 full-load equivalent cooling/packing positions. Maximum packed staging wait before vehicle loading is 45 minutes. These waits affect crust quality and sales freshness and must be tested.

The final delivery is later than the final bake because one vehicle must finish its earlier trip before collecting the last load. The workbook exposes that queue. Use preorders and measured afternoon demand; a larger campaign is not automatically a better commercial choice. If the market needs all 800 pieces early in the morning, this programme does not meet that requirement. A separately validated earlier start, fermentation-retardation process, capacity expansion or revised product mix would be needed. Provide shift relief and handovers; do not assign a single person to an unbroken extended shift.

Day-before preparation and staffing

Opening allocation: M1 checks scales, ingredient labels and the mixer from 02:00–02:10, then preweighs batch 1 from 02:10–02:20. D2/F3 prepare clean work surfaces, bins and trays. O4 checks the oven and steam system before starting an approved preheat programme. A provisional 45-minute preheat lead would mean 04:08 for the default first scoring/loading slot at 04:53; actual required lead time and readiness override this illustration. Count preheat and standby fuel/electricity in campaign costs. Complete opening sanitation before exposed-food handling.

BAG-H2-01 is direct dough and does not require a poolish. Before the night shift, arrange water-temperature control, ingredients, clean racks/trays, labelled bulk bins, dispatch crates, fuel and customer orders. Do not leave mixed dough overnight under this recipe.

M1-B12 is a different poolish baguette. Its 300 g flour, 300 g water and 0.3 g yeast preferment per 1 kg total flour are part of the total formula. Its 12–16-hour maturation must be started the previous day and assessed for readiness. Do not use BAG-H2-01's clock or add a second full flour/water charge. M1-B13 is a softer baguette; S-B01 is another daily baguette formula. Each requires its own dough, proof, bake and dispatch validation before being assigned a production programme.

Role	Reserved work	Coverage / staffing condition
M1 mixer lead	10 min preweigh before mix; 18-min mix/rest supervision; 7-min transfer and clean	35 minutes reserved per batch. On the extended plan relief R6 covers all of batch 4 weighing/mixing/cleanup so M1 can take an uninterrupted break; further breaks require recorded coverage.
D2 divider/preshaper	15-min division plus 5-min bench clean	Separate from F3. Keep FIFO labels and weight checks; batch count assumes this rate can be maintained.
F3 moulder/rack loader	15-min mould/load plus 5-min work-area clean	Track first/last tray formation age; use a separate surface so cleaning does not obstruct D2.
O4 oven/proof lead	Proof endpoint checks, 10-min score/load, supervised bake, 3-min unload and recovery monitoring	Dedicated to hot operations; do not use this person as the delivery driver. Arrange qualified relief during the extended campaign.
P5 cooling/packing	Cooling checks, 15-min pack, 10-min rack/tray cleanup; opening/closing support	Packing and dispatch staging must remain separate from raw-food handling.
R6 relief	Named trained relief for break coverage and handovers	Extended campaign needs planned staffing beyond uninterrupted single-worker shifts. Never double-book the relief person across simultaneous roles.

Role	Reserved work	Coverage / staffing condition
Driver / B receiver	Vehicle waves as listed; independent receiving person at B	Load handover is not full receiving-staff capacity planning. Confirm vehicle/crate capacity for the largest wave and retailer storage.

Treat the roles as the resource model, not proof of the exact payroll required. Named people, opening/closing periods, lawful shift arrangements, breaks and paid hours must be assigned before release. Short gaps between tasks are not automatically sufficient rest breaks. The workbook schedules production stages and vehicle use; the supervisor must also schedule quality checks, breaks and other products. The extended programme remains on hold if that staffing plan is not supplied.

Purchasing, complete costing and sensitivity

Programme	Flour kg	Water kg	Salt kg	Yeast kg	Known subtotal FCFA
PLAN-BAG-P	14.388	9.496	0.2878	0.0720	6,218.92
PLAN-BAG-N	71.940	47.480	1.4390	0.3595	31,093.77
PLAN-BAG-H	143.880	94.960	2.8780	0.7190	62,187.54

These are campaign consumption quantities, not instructions to buy a full bag/carton for every batch. Flour bags are 50 kg; yeast packs are 450 g. Deduct usable opening stock, choose a documented stock buffer, then round purchasing to supplier packs. Record chilled-water/ice energy, dusting flour and leftovers separately. Never add ice on top of the recipe water allowance.

The editable workbook leaves water, packaging, dusting/consumables, electrical energy, diesel, variable staffing and transport blank until supplied. A genuinely zero cost must be explicitly entered as zero. Full variable campaign cost and contribution stay unavailable while required fields are blank. All paid staffing relevant to the campaign must be included once; do not add both a full shift and the same batch labour again.

No selling price is imposed. Enter a candidate price and expected sold units only after a customer and outlet check. Contribution is revenue less complete variable cost; fixed rent, depreciation, financing and other fixed expenses still separate it from net profit. Cold storage and other products may share power and labour; document an allocation instead of assuming baguettes use the entire generator or that all energy is free solar power at 02:00.

Sensitivity checks to run before release: 10% flour-price increase; lower actual sold units; 4 instead of 5 pieces/tray; proof 90 instead of 60 minutes; slower moulding; recovery 23 instead of 5 minutes; longer cooling; and delayed vehicle return. A resource conflict means the schedule is invalid until recalculated, not permission to hold proofed dough indefinitely.

Contingencies, quality and release records

Trigger	Action
Proof not ready	Bake by dough endpoint; record the extension, hold the next mix if needed and recalculate bay/cadence requirements. Do not compress bulk or proof to catch up.
Dough ready before oven	Stop further starts; assess the batch with the lead baker. No unverified fridge/retarder shortcut or repeated arbitrary knock-back is prescribed.
Power or diesel interruption	Stop machinery safely, protect cold stores and record dough stage/time/temperature. Follow equipment restart procedures. Decide batch disposition from condition; recalculate the queue before restarting.
Slow recovery / pale or uneven bake	Measure loaded oven recovery and map tray levels. Reduce load or revise oven cycle. Do not direct combustion exhaust toward food, staff or the street.
Moulding tears / sticking	Check relaxation, flour absorption, dough temperature, roller gaps and measured dusting. Do not add flour or oil without logging the formula change.
Weight / reject variance	Check scales and cooled samples across trays. Recalculate portions, handling loss, bake loss and rejects from measurements; do not sell an assumed net weight.
Cooling or packaging condensation	Delay packing until release criteria pass; expand protected cooling space or slow starts. Record the delay and its rack impact.
Delivery delay / low sell-through	Keep protected staging, notify the receiving team through normal business procedures, reduce subsequent production and update sold-unit costing. Do not make additional batches solely to keep the oven busy.

For each trial record: recipe/version; date; batch; operator/relief; ingredient lots and weighed masses; room/flour/water/dough temperatures; actual mix end; bulk start/end; first/last divide and mould; proof start/end and actual temperature/humidity; score/load and bake times; steam programme; unloaded weight/count; recovery time; cooled sample weights; rejects/leftovers; packing release; tray/rack available time; staff hours; water/dusting/oil-free process consumables; electricity and diesel; dispatch/arrival/return; B receipt; sold/returned units; full cost; corrective action; reviewer.

Run at least three independently acceptable trials of the selected load and cadence before treating the programme as an operating standard. The programme is conditional on demonstrated product quality, safe handling and resource availability. Reissue the schedule when recipe, portion, oven load, proof duration, staff or route changes.

Technical reference and evidence limit

King Arthur's professional baguette material reinforces that fermentation, shaping and steam are process-specific. Its professional sourdough formula uses a different fermentation system and is not the recipe adopted here. The H2 numerical timings come from the audited local sources and explicit planning assumptions, not from a manufacturer validation of this oven. King Arthur professional baguette reference

The source register distinguishes the local documents from this external technical reference. C01–C05 and their authoritative references remain in the anthology. This new section establishes no new Cameroon legal limit, food shelf life or guaranteed output.

H2 integration and verification record

H2 adds one traceable recipe, BAG-H2-01, and three planning scenarios to the 137 working cards and 792 H1 coverage records. It preserves all earlier formulas, variants, prices and unresolved source records. H1 remains unchanged. The corrected baguette section supersedes conflicting scheduling statements for BAG-H2-01 only; it does not rewrite another recipe's fermentation method.

The programme has been checked for batch mass, integer portions, loss arithmetic, source discrepancies, nonoverlapping equipment bookings, two-bay proof allocation, rack/cooling peaks and serialized delivery trips. Passing those arithmetic checks does not validate the assumed cycle times, named staffing, product quality or customer demand. Open gates remain visible in the workbook and issue register.

Working recipe cards

Cards with shared components are read together. “Commercial” means a scaling example, not permission to load equipment beyond verified limits. Recipes remain provisional until their batch record is signed.

Module 1 breads and baguettes

M1-B01 Standard English block bread

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B01.

A lightly sweet, soft sandwich loaf with a fine, resilient crumb and a golden crust. This is a proposed local-market trial, not a claim to reproduce a particular existing Nkambe loaf.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	50.00	500.00	5.00
Millac Premium powder	20.00	200.00	2.00
Roma margarine	40.00	400.00	4.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	10.00	100.00	1.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 45–60 min at 25–27°C; aim for about 60–80% volume increase, not collapse.

3. Shape: Flatten each 500 g piece gently, roll into a tight log, seal and place seam-down in a greased tin. Trial internal dimensions around 20 × 10 × 10 cm; confirm by tin-volume and proof-height tests before ordering tins.

4. Proof: 45–70 min at about 28–30°C. For the trial open tin, start baking when the crown is approximately level with or just above the rim and a light indentation recovers slowly.

5. Bake or cook: 185–195°C, approximately 28–35 min; begin checking at 25 min. No steam is needed. Trial crumb endpoint 93–96°C plus a set, non-gummy crumb.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Begin with 4 tins per 60 × 40 cm tray, arranged 2 × 2 with air gaps. Confirm external tin dimensions, rack pitch and airflow; do not infer full-rack capacity from tray area.

Active labour: 25–35 min pilot; 40–60 min at 10 kg flour, excluding washing and rack moves. Elapsed: About 3.5–4.5 h including cooling; fermentation is condition-dependent.

Yield model: 1,740.00 g input; assume 1% handling loss → 1,722.60 g usable dough; 3 whole pieces × 500 g raw with 222.60 g leftover. Trial bake loss 10–14%; midpoint saleable mass 1,320.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: A like-for-like bakery margarine can replace Roma by equal mass only after matching fat and salt content. Bread flour from another supplier needs a new water-absorption trial; do not change flour and yeast simultaneously.

Defect	Likely cause	Trial correction
Dense base	Insufficient final proof or weak shaping	Check dough temperature, proof development and seam tension; do not add yeast blindly.

Defect	Likely cause	Trial correction
Waisted or collapsed loaf	Overproofing or unsuitable tin fill	Reduce proof endpoint or dough weight after a measured tin trial.
Dry crumb	Overbaking or too little water for the flour	Measure baked weight loss and record a controlled water adjustment in the next trial.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	50.00	640.00	32.00
Millac Premium powder	20.00	3,200.00	64.00
Roma margarine	40.00	1,333.33	53.33
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	10.00	1,666.67	16.67

Known ingredient subtotal: **589.89 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 196.63 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 19.66 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B02 Golden milk loaf

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B02.

A soft, evenly textured, moderately sweet family loaf with a milk-powder aroma. Millac and Roma make this a dairy-containing, vegetable-fat-enriched trial formula, not an all-butter or all-milk-fat loaf.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	100.00	1,000.00	10.00
Millac Premium powder	60.00	600.00	6.00
Roma margarine	80.00	800.00	8.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	12.00	120.00	1.20

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 50–70 min at 25–27°C; aim for 60–80% expansion.

3. Shape: Scale 500 g; flatten, roll tightly and seal. Use the same provisional 20 × 10 × 10 cm internal tin trial as B01. Compare three independently mixed batches before fixing tin fill.

4. Proof: 60–90 min around 28–30°C, ending at the measured tin-height target with slow indentation recovery.

5. Bake or cook: 175–185°C, about 28–36 min. Start at 180°C without steam; check from 25 min. Trial crumb endpoint 93–96°C and an evenly set centre.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 4 tins per tray. Keep this richer loaf separate from hotter baguette loads.

Active labour: 30–40 min pilot; 45–65 min at 10 kg flour. Elapsed: About 4–5 h with cooling; sweet dough may ferment slowly with an unsuitable yeast strain.

Yield model: 1,872.00 g input; assume 1% handling loss → 1,853.28 g usable dough; 3 whole pieces × 500 g raw with 353.28 g leftover. Trial bake loss 10–14%; midpoint saleable mass 1,320.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Whole milk powder can be tested at the same 60 g mass, but this changes fat, protein and lactose balance and is a new recipe version. Sweetened condensed milk is not a one-for-one replacement: obtain its composition and rebalance sugar, water and fat before using it.

Defect	Likely cause	Trial correction
Dark crust before centre sets	Sugar and milk solids brown quickly	Lower the next bake by 5–10°C and verify core and weight loss.

Defect	Likely cause	Trial correction
Slow proof	Yeast not suited to enriched dough or low dough temperature	Confirm Nevada variant, dough temperature and shelf condition; test a manufacturer-recommended sweet-dough yeast.
Greasy crumb	Fat added too early or poor incorporation	Develop the dough partially before adding softened margarine in stages.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	100.00	640.00	64.00
Millac Premium powder	60.00	3,200.00	192.00
Roma margarine	80.00	1,333.33	106.67
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **806.56 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 268.85 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 26.89 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B03 Tea rolls with Roma margarine

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B03.

Small, soft breakfast rolls with a fine crumb and an even golden top. These reconcile the report's butter tea rolls with the supplied Roma margarine. Use a butter name only for a butter formulation.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	580.00	5,800.00	58.00
White granulated sugar	80.00	800.00	8.00
Millac Premium powder	40.00	400.00	4.00
Roma margarine	100.00	1,000.00	10.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	12.00	120.00	1.20

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 45–60 min at 25–27°C to about 60–80% expansion.

3. Shape: Round 60 g pieces with the seam underneath. Leave unglazed for the baseline trial. Aim for a finished diameter about 6–7 cm, then adjust against actual expansion.

4. Proof: 45–70 min at 28–30°C; rolls look aerated and a shallow indentation returns slowly.

5. Bake or cook: 175–185°C for about 12–17 min without steam. Begin checking at 11 min; centre should be set with no wet streaks.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 24 pieces per 60 × 40 cm tray in 6 × 4 rows, about 10 cm centres. Reduce count if rolls touch before the desired crust forms.

Active labour: 25–35 min pilot; 55–80 min at 10 kg flour by hand. Elapsed: About 3–4 h including cooling.

Yield model: 1,830.00 g input; assume 1% handling loss → 1,811.70 g usable dough; 30 whole pieces × 60 g raw with 11.70 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,620.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: For a butter trial, replace the 100 g Roma with 100 g unsalted butter only if Roma is a comparable roughly 80–82% fat baking margarine. Otherwise rebalance from labels first. Butter changes flavour, cost and allergen declaration; compare as a separately costed B03 variant.

Defect	Likely cause	Trial correction
Rolls merge excessively	Tray density too high	Reduce from 24 to 20 or 18 pieces after measuring proofed width.
Tough surface	Proofing skin or excessive bench flour	Cover trays without contact and minimise measured dusting flour.

Defect	Likely cause	Trial correction
Weak margarine flavour appeal	Fat flavour does not meet target	Blind-test the butter variant against the Roma version, with its added cost shown.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	580.00	UNPRICED	UNPRICED
White granulated sugar	80.00	640.00	51.20
Millac Premium powder	40.00	3,200.00	128.00
Roma margarine	100.00	1,333.33	133.33
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **756.03 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 25.20 FCFA for 30 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.52 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B04 Sweet milk buns

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B04.

An affordable round sweet bun with a soft, close crumb and moderate milky flavour. It can later support filled-bun variants, but those need their own filling and food-safety cards.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	120.00	1,200.00	12.00
Millac Premium powder	40.00	400.00	4.00
Roma margarine	60.00	600.00	6.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	12.00	120.00	1.20

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 50–70 min at 25–27°C until visibly aerated, about 60–80% expansion.

3. Shape: Round 80 g pieces with a sealed underside. Baseline finish is plain: no egg wash, glaze or filling is included in this formula.

4. Proof: 60–90 min at 28–30°C. Judge expansion and slow spring-back; do not force proof by overheating.

5. Bake or cook: 175–185°C for about 14–18 min without steam. Start checking at 13 min and confirm an evenly set centre.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 20 pieces per tray in 5 × 4 rows. Target a finished diameter around 7–8 cm; maintain clearance after proof.

Active labour: 25–35 min pilot; 50–75 min at 10 kg flour by hand. Elapsed: About 3.5–4.5 h with cooling.

Yield model: 1,850.00 g input; assume 1% handling loss → 1,831.50 g usable dough; 22 whole pieces × 80 g raw with 71.50 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,584.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Use a manufacturer-recommended osmotolerant instant yeast at its stated starting dose if Nevada cannot perform reliably at 12% added sugar. Recalculate formula totals if the dose changes. Do not substitute active dry yeast without its supplier’s conversion and activation method.

Defect	Likely cause	Trial correction
Small dense buns	Underproofing in sweet dough	Check yeast suitability and actual dough temperature first.
Variable size	Uncontrolled hand division	Weigh every pilot piece and every tenth commercial piece.

Defect	Likely cause	Trial correction
Sticky packaging	Packed while warm	Cool with air circulation and verify the condensation test before closing bags.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	120.00	640.00	76.80
Millac Premium powder	40.00	3,200.00	128.00
Roma margarine	60.00	1,333.33	80.00
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **728.30 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 33.10 FCFA for 22 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.31 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B05 Coconut sweet buns

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B05.

A soft bun with coconut distributed through the crumb. The recipe uses dry, unsweetened coconut, not fresh grated coconut or sweetened coconut flakes.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	650.00	6,500.00	65.00
White granulated sugar	120.00	1,200.00	12.00
Millac Premium powder	40.00	400.00	4.00
Roma margarine	60.00	600.00	6.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	12.00	120.00	1.20
Unsweetened fine desiccated coconut	100.00	1,000.00	10.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 50–70 min at 25–27°C to about 60–80% expansion.

3. Shape: Round 90 g pieces; do not add a moist topping. Coconut must already have been incorporated at the end of mixing, before bulk fermentation.

4. Proof: 60–90 min at 28–30°C until light and aerated with slow spring-back.

5. Bake or cook: 175–180°C for roughly 15–20 min, no steam. Check from 14 min; avoid scorching coconut at the surface.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 20 pieces per tray in 5 × 4 rows. Inspect expansion and coconut browning on the top and bottom racks.

Active labour: 30–40 min pilot; 60–85 min at 10 kg flour. Elapsed: About 3.5–4.5 h including cooling.

Yield model: 2,000.00 g input; assume 1% handling loss → 1,980.00 g usable dough; 22 whole pieces × 90 g raw with 0.00 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,782.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Another unsweetened fine desiccated coconut can replace the same 100 g, with a hydration trial. Fresh coconut is not an equivalent substitute: it changes water, microbial risk and shelf life. Declare coconut as an ingredient and assess customer-specific allergy needs.

Defect	Likely cause	Trial correction
Dry crumb	Coconut absorbed more water than assumed	Measure softness and test 10 g/kg flour more water in a new trial, recording the revised yield.

Defect	Likely cause	Trial correction
Poor rise	Coconut added before gluten develops	Add the hydrated coconut late on low speed.
Scorched flakes	Exposed particles and excessive heat	Reduce setpoint slightly or improve distribution; do not underbake the centre.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	650.00	UNPRICED	UNPRICED
White granulated sugar	120.00	640.00	76.80
Millac Premium powder	40.00	3,200.00	128.00
Roma margarine	60.00	1,333.33	80.00
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00
Unsweetened fine desiccated coconut	100.00	UNPRICED	UNPRICED

Known ingredient subtotal: **728.30 FCFA per pilot**. Unpriced or unresolved inputs: Potable water, Unsweetened fine desiccated coconut. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 33.10 FCFA for 22 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.31 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B06 Raisin milk buns

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B06.

A soft sweet bun with evenly distributed raisins, suitable as a premium breakfast snack. Raisins are weighed dry as purchased; no soaking liquid is included.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	100.00	1,000.00	10.00
Millac Premium powder	40.00	400.00	4.00
Roma margarine	60.00	600.00	6.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	12.00	120.00	1.20
Ready-to-use seedless raisins	200.00	2,000.00	20.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 50–70 min at 25–27°C; avoid tearing the dough while folding.

3. Shape: Round 100 g pieces and tuck exposed raisins into the surface. Raisins must already have been incorporated at the end of mixing, before bulk fermentation.

4. Proof: 60–90 min at 28–30°C; use dough expansion and indentation recovery.

5. Bake or cook: 175–185°C for roughly 16–21 min without steam. Check from 15 min; shield by process adjustment rather than removing burnt fruit after baking.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 20 pieces per tray in 5 × 4 rows; reduce to 18 if the buns touch after proof.

Active labour: 30–45 min pilot; 65–90 min at 10 kg flour. Elapsed: About 3.5–4.5 h including cooling.

Yield model: 2,030.00 g input; assume 1% handling loss → 2,009.70 g usable dough; 20 whole pieces × 100 g raw with 9.70 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,800.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Sultanas of similar moisture and size can replace raisins gram for gram. Check sulphite declarations. Do not add a soaking stage without weighing absorbed water and revising the formula and holding procedure.

Defect	Likely cause	Trial correction
Fruit falls out	Exposed raisins at shaping	Tuck fruit inside and tighten the seam gently.
Torn crumb	Overmixing after fruit addition	Add raisins only after gluten development and use the lowest practical speed.

Defect	Likely cause	Trial correction
Uneven sweetness	Poor distribution	Inspect cut pilot buns from different parts of the batch.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	100.00	640.00	64.00
Millac Premium powder	40.00	3,200.00	128.00
Roma margarine	60.00	1,333.33	80.00
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00
Ready-to-use seedless raisins	200.00	UNPRICED	UNPRICED

Known ingredient subtotal: **715.50 FCFA per pilot**. Unpriced or unresolved inputs: Potable water, Ready-to-use seedless raisins. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 35.78 FCFA for 20 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.58 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B07 Cinnamon milk buns

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B07.

A fragrant, soft cinnamon bun with spice throughout the crumb. This version is a round bun, not a filled cinnamon scroll; it requires no uncosted icing.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	120.00	1,200.00	12.00
Millac Premium powder	40.00	400.00	4.00
Roma margarine	60.00	600.00	6.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	14.00	140.00	1.40
Ground cinnamon	10.00	100.00	1.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 60–80 min at 25–27°C; cinnamon and sugar may slow fermentation.

3. Shape: Round 80 g pieces; the cinnamon must already be evenly mixed into the dough. Keep the spice quantity exact and record whether it slows the chosen yeast.

4. Proof: 60–100 min at 28–30°C, subject to actual expansion and slow indentation recovery.

5. Bake or cook: 175–185°C for about 14–19 min without steam. Check from 13 min; crumb colour is naturally darker than B04.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 20 pieces per tray in 5 × 4 rows. Use no wet glaze in the baseline trial.

Active labour: 25–35 min pilot; 50–75 min at 10 kg flour. Elapsed: About 3.5–5 h including cooling.

Yield model: 1,862.00 g input; assume 1% handling loss → 1,843.38 g usable dough; 23 whole pieces × 80 g raw with 3.38 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,656.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Use the same cinnamon species and grind between batches. A 1:1 brand substitution requires a tasting trial because aroma strength varies. A cinnamon scroll with filling or icing is a new product requiring separate components and cost calculations.

Defect	Likely cause	Trial correction
Very slow rise	Spice potency or yeast tolerance	Confirm the 10 g dose and compare a small control batch without cinnamon.

Defect	Likely cause	Trial correction
Bitter flavour	Excessive or uneven spice	Check scale accuracy and sift the spice through the flour.
Uneven crumb colour	Poor dry blending	Blend flour and cinnamon uniformly before adding liquids.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	120.00	640.00	76.80
Millac Premium powder	40.00	3,200.00	128.00
Roma margarine	60.00	1,333.33	80.00
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	14.00	1,666.67	23.33
Ground cinnamon	10.00	UNPRICED	UNPRICED

Known ingredient subtotal: **731.63 FCFA per pilot**. Unpriced or unresolved inputs: Ground cinnamon, Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 31.81 FCFA for 23 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.18 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B08 Baked garlic and herb bread

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B08.

A savoury, aromatic small loaf with garlic and dried herbs baked into the dough. It avoids making or storing a fresh-garlic-in-oil spread.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	620.00	6,200.00	62.00
White granulated sugar	20.00	200.00	2.00
Neutral food-grade oil	40.00	400.00	4.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	10.00	100.00	1.00
Food-grade garlic powder	8.00	80.00	0.80
Dried mixed herbs	4.00	40.00	0.40

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 60–75 min at 25–27°C to roughly 70% expansion; fold once midway if slack.

3. Shape: Shape 250 g oval loaves and seal underneath. The garlic powder and herbs must already be mixed into the dough.

4. Proof: 40–60 min at 28–30°C until aerated with slow spring-back.

5. Bake or cook: 195–205°C for about 20–26 min. No steam in the baseline. Trial centre 94–97°C plus a fully set crumb.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 8 pieces per tray in 2 × 4 rows, with long axes along the 60 cm direction. Target about 18 cm finished length and retain airflow gaps.

Active labour: 25–35 min pilot; 40–60 min at 10 kg flour. Elapsed: About 3–4 h including cooling.

Yield model: 1,720.00 g input; assume 1% handling loss → 1,702.80 g usable dough; 6 whole pieces × 250 g raw with 202.80 g leftover. Trial bake loss 10–14%; midpoint saleable mass 1,320.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Keep dried herb blend composition constant and obtain supplier allergen details. Do not replace garlic powder with equal-weight fresh garlic. Fresh garlic butter is a separate refrigerated component requiring its own validated handling procedure.

Defect	Likely cause	Trial correction
Weak rise	Excess garlic or poor dispersion	Verify 8 g/kg flour and distribute evenly.
Bitter herbs	Overbaking or poor spice quality	Use a fresh, documented spice lot and verify bake loss.

Defect	Likely cause	Trial correction
Uneven shape	Insufficient bench rest	Allow the stated rest before extending the dough; do not tear it.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	620.00	UNPRICED	UNPRICED
White granulated sugar	20.00	640.00	12.80
Neutral food-grade oil	40.00	1,413.04	56.52
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	10.00	1,666.67	16.67
Food-grade garlic powder	8.00	UNPRICED	UNPRICED
Dried mixed herbs	4.00	UNPRICED	UNPRICED

Known ingredient subtotal: **509.49 FCFA per pilot**. Unpriced or unresolved inputs: Dried mixed herbs, Food-grade garlic powder, Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 84.91 FCFA for 6 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 8.49 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B09 Soft burger buns

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B09.

A soft but resilient bun that holds a cooked patty and sauces without disintegrating. The baseline has no sesame, egg wash or filling.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	600.00	6,000.00	60.00
White granulated sugar	60.00	600.00	6.00
Millac Premium powder	30.00	300.00	3.00
Roma margarine	60.00	600.00	6.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	12.00	120.00	1.20

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 45–60 min at 25–27°C to about 60–80% expansion.

3. Shape: Round 90 g pieces, rest 10 min, then flatten to an even 8–9 cm disc. Trial a finished diameter about 10–11 cm; size against the actual patty.

4. Proof: 45–75 min at 28–30°C until visibly light with slow spring-back.

5. Bake or cook: 180–190°C for about 13–18 min, no steam. Start checking at 12 min; verify a resilient fully set centre.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 15 buns per tray in 5 × 3 rows. Allow roughly 12–13 cm centres; confirm after proof.

Active labour: 25–35 min pilot; 50–75 min at 10 kg flour. Elapsed: About 3–4 h including cooling.

Yield model: 1,782.00 g input; assume 1% handling loss → 1,764.18 g usable dough; 19 whole pieces × 90 g raw with 54.18 g leftover. Trial bake loss 8–12%; midpoint saleable mass 1,539.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: For a seeded variant, add exactly 1 g sesame per bun before baking using a separately specified adhesion method; add its cost and allergen declaration. The unseeded base remains the control. Do not cost a seeded bun as the plain recipe.

Defect	Likely cause	Trial correction
Bun collapses under filling	Underbake or overproof	Check crumb set and proof endpoint; assess with the standard patty and sauce weights in the later assembly card.
Too domed	Insufficient flattening	Flatten uniformly after rounding and resting.

Defect	Likely cause	Trial correction
Soggy cut faces	Wet filling or early assembly	Toast only at assembly and control sauce and filling quantities.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	600.00	UNPRICED	UNPRICED
White granulated sugar	60.00	640.00	38.40
Millac Premium powder	30.00	3,200.00	96.00
Roma margarine	60.00	1,333.33	80.00
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **658.29 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 34.65 FCFA for 19 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.46 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B10 Soft shawarma flatbreads

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B10.

A thin, flexible flatbread that wraps around a weighed filling without cracking. This is a pan-cooked wrap, not a pocket-pita specification.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	580.00	5,800.00	58.00
White granulated sugar	20.00	200.00	2.00
Neutral food-grade oil	50.00	500.00	5.00
Fine food-grade salt	18.00	180.00	1.80
Nevada instant dry yeast	5.00	50.00	0.50

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 30–45 min at 25–27°C, allowing gentle relaxation rather than doubling.

3. Shape: Round 90 g balls, cover and rest 20–30 min. Roll to 24–26 cm diameter and about 1.5–2 mm thickness. If it springs back, rest 5 min rather than forcing it.

4. Proof: No extended final proof: rest rounded balls 20–30 min covered, then cook promptly after rolling.

5. Bake or cook: Trial pan surface 190–210°C, roughly 40–60 s first side and 30–50 s second side, then brief turns as needed. Require opaque set dough throughout with light brown spots and no wet raw-flour layer.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Use a flat, induction-compatible 28–30 cm pan or verified production griddle at Facility A. Stage rolled pieces singly; do not assume the rotary oven reproduces pan cooking.

Active labour: 35–50 min pilot on one pan; commercial labour depends on pan count and includes continuous tending. Elapsed: Pilot about 2–2.5 h with cooling. At 10 kg flour, plan 184 breads after the assumed handling loss; one pan at 90–120 s each needs about 4.6–6.2 h just to cook. Split into several smaller dough batches.

Yield model: 1,673.00 g input; assume 1% handling loss → 1,656.27 g usable dough; 18 whole pieces × 90 g raw with 36.27 g leftover. Trial bake loss 7–11%; midpoint saleable mass 1,474.20 g. Measure rather than printing this as a verified label weight.

Controlled substitution: A similar neutral oil may replace the listed oil gram for gram. Oil and margarine are not interchangeable at equal mass without a water/fat rebalance. A baked pocket pita requires another formulation and a validated oven method.

Defect	Likely cause	Trial correction
Cracking when folded	Overcooking or excessive bench flour	Reduce exposure after the centre sets; weigh dusting flour and use controlled short covered stacking.

Defect	Likely cause	Trial correction
Raw layer	Pan too hot or bread too thick	Reduce heat and standardise thickness, then validate cooking time.
Condensation in bags	Packed before cooling	Vent the cooling stack and pack only after the condensation test passes.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	580.00	UNPRICED	UNPRICED
White granulated sugar	20.00	640.00	12.80
Neutral food-grade oil	50.00	1,413.04	70.65
Fine food-grade salt	18.00	194.44	3.50
Nevada instant dry yeast	5.00	1,666.67	8.33

Known ingredient subtotal: **515.29 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 28.63 FCFA for 18 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.86 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B11 Small sandwich rolls

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B11.

A lightly enriched oval roll for egg, chicken or beef fillings. It has a firmer structure than the sweet bun and remains a plain bread until assembly.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	620.00	6,200.00	62.00
White granulated sugar	40.00	400.00	4.00
Neutral food-grade oil	40.00	400.00	4.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	10.00	100.00	1.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 50–65 min at 25–27°C to about 70% expansion.

3. Shape: Round 100 g pieces, rest 10–15 min and roll into 13–15 cm ovals. Seal underneath; keep covered until final proof.

4. Proof: 45–65 min at 28–30°C until aerated and slow to spring back.

5. Bake or cook: 190–200°C for about 15–20 min, without steam in the baseline. Check from 14 min; trial core 94–97°C with a set crumb.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 12 pieces per tray in 3 × 4 rows; long axes along the 60 cm side. Verify actual final length and spacing.

Active labour: 25–35 min pilot; 45–65 min at 10 kg flour. Elapsed: About 3–4 h including cooling.

Yield model: 1,730.00 g input; assume 1% handling loss → 1,712.70 g usable dough; 17 whole pieces × 100 g raw with 12.70 g leftover. Trial bake loss 9–13%; midpoint saleable mass 1,513.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Another refined neutral oil can replace the same mass. Do not make a milk-powder substitution in this recipe because no milk powder is specified. Adding dairy creates a new formula and changes allergen handling.

Defect	Likely cause	Trial correction
Side bursts	Tight skin or insufficient proof	Cover during proof, check proof maturity and improve scoring.
Roll too chewy	Excess bake loss or insufficient enrichment for target	Verify actual loss first; change one formula variable in the next trial.
Uneven filling fit	Length inconsistent	Use a simple length guide at shaping and weigh each pilot piece.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	620.00	UNPRICED	UNPRICED
White granulated sugar	40.00	640.00	25.60
Neutral food-grade oil	40.00	1,413.04	56.52
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	10.00	1,666.67	16.67

Known ingredient subtotal: **522.68 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 30.75 FCFA for 17 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.07 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B12 French-style poolish baguettes

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B12.

See the preferment allocation below; all poolish flour and water are included once in the formula.

A lean, crisp-crusted baguette with an irregular, moderately open crumb and fermented aroma. A poolish is a flour-and-water preferment. This is a proposed adaptation, not a certified French designation.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	680.00	6,800.00	68.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	5.00	50.00	0.50

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Prepare poolish using 300 g of the listed flour, 300 g of the listed water and 0.3 g of the listed yeast. Ferment covered about 12–16 h at 20–22°C until bubbly and just beginning to flatten; adapt to room temperature. Add the remaining 700 g flour, remaining water, remaining yeast and all salt to the mature poolish. Mix to an elastic, extensible dough at 24–26°C. Do not add a second full flour or water quantity.

2. Bulk fermentation: 90–120 min at 24–26°C with a gentle fold at about 45–60 min; stop before the dough becomes weak.

3. Shape: Divide gently into 300 g pieces, pre-shape short cylinders, rest 20 min covered and extend to 45–50 cm without forcing. Keep covered; scoring takes place after final proof, immediately before loading.

4. Proof: 40–60 min at about 25–28°C, protected from drying. Look for expansion and slight recovery after a gentle indentation.

5. Bake or cook: 225–235°C initial trial for about 20–26 min. Apply only the manufacturer’s approved steam dose at loading; vent near the end as instructed. Target a crisp golden crust, set crumb and trial core 96–98°C.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 4 baguettes per 60 × 40 cm perforated tray, long axes along the 60 cm side. Check rack clearance, safe handling and the oven’s steam instructions.

Active labour: 30–45 min pilot plus 5–10 min poolish preparation; 50–75 min at 10 kg flour. Elapsed: Poolish 12–14 h under controlled 20–22°C conditions, then about 3.5–4.5 h for final dough through cooling. A 02:00 final mix requires prior-day poolish preparation.

Yield model: 1,705.00 g input; assume 1% handling loss → 1,687.95 g usable dough; 5 whole pieces × 300 g raw with 187.95 g leftover. Trial bake loss 16–22%; midpoint saleable mass 1,215.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: A comparable extensible bread flour can replace the flour after an absorption and shaping test. If no controlled cool space exists for poolish, do not leave it overnight in unknown heat: trial a separately timed same-day method before production.

Defect	Likely cause	Trial correction
Dense crumb	Excess degassing or underproof	Handle gently after bulk fermentation and assess proof maturity.

Defect	Likely cause	Trial correction
Poor ear or side tear	Scoring angle or skin drying	Use a clean sharp blade and protect proofing dough from drafts.
Soft crust	Too little drying or sealed packaging	Follow approved venting instructions and use paper sleeves after full cooling.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	680.00	UNPRICED	UNPRICED
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	5.00	1,666.67	8.33

Known ingredient subtotal: **432.22 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 86.44 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 8.64 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

M1-B13 Soft baguette-style bread

Status: Retained Module 1 formulation — production trial required

Source: S016; recipe B13.

A softer, lightly enriched long bread for customers who prefer easier chewing or sandwiches. Label it soft baguette-style bread so its texture promise is clear.

Ingredient	Pilot g	Production g	Baker %
Le Choix du Boulanger flour	1,000.00	10,000.00	100.00
Potable water	620.00	6,200.00	62.00
White granulated sugar	30.00	300.00	3.00
Neutral food-grade oil	30.00	300.00	3.00
Fine food-grade salt	20.00	200.00	2.00
Nevada instant dry yeast	10.00	100.00	1.00

Pilot flour 1,000 g; commercial example 10,000 g flour. Both are planning scales; use a mixer within its verified load limits.

Production method

1. Weigh every ingredient and record water temperature. For plain/enriched dough, mix the dry ingredients with most of the listed water, develop partly, then add margarine or oil gradually. Add raisins or coconut late before bulk fermentation. Target 25–27°C dough.

2. Bulk fermentation: 60–75 min at 25–27°C with one gentle fold if needed.

3. Shape: Divide 300 g, pre-shape a cylinder, rest 15–20 min and extend to about 40–45 cm. Seal the seam; score after final proof, immediately before loading.

4. Proof: 45–65 min at 28–30°C, ending when aerated with slow indentation recovery.

5. Bake or cook: 195–205°C for approximately 20–27 min. Baseline uses no steam; target a thin golden crust and trial core 94–97°C. Avoid an extended dry-out phase.

6. Cool on protected racks, weigh cooled pieces and pack only when condensation does not form. Score baguettes after proof, immediately before loading.

Equipment and layout: Start with 4 pieces per 60 × 40 cm tray, lengthways along the 60 cm side. Keep separate from B12's hotter, drier bake.

Active labour: 25–40 min pilot; 45–65 min at 10 kg flour. Elapsed: About 3–4 h including cooling.

Yield model: 1,710.00 g input; assume 1% handling loss → 1,692.90 g usable dough; 5 whole pieces × 300 g raw with 192.90 g leftover. Trial bake loss 10–14%; midpoint saleable mass 1,320.00 g. Measure rather than printing this as a verified label weight.

Controlled substitution: Use a neutral oil of similar flavour at the same mass. Do not add milk or margarine without recalculating the dough and allergens. Compare customer preference and contribution against B12 in a small controlled trial.

Defect	Likely cause	Trial correction
Crust too hard	Too much drying or excessive bake loss	Shorten the dry-out phase while still fully baking the centre.
Wrinkled sides	Overproofing or packed warm	Check proof endpoint and cool on racks before bagging.

Defect	Likely cause	Trial correction
Too little flavour	Rushed fermentation	Check dough temperature and bulk development before changing salt or sugar.

Harmonization and current cost audit

Preserve this owner-priced v0.2 recipe as a distinct variant. New cost audit includes every ingredient; no unmeasured operating expense is assumed to be zero.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Le Choix du Boulanger flour	1,000.00	420.00	420.00
Potable water	620.00	UNPRICED	UNPRICED
White granulated sugar	30.00	640.00	19.20
Neutral food-grade oil	30.00	1,413.04	42.39
Fine food-grade salt	20.00	194.44	3.89
Nevada instant dry yeast	10.00	1,666.67	16.67

Known ingredient subtotal: **502.15 FCFA per pilot**. Unpriced or unresolved inputs: Potable water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 100.43 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 10.04 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Repeat independently before scale-up.

Shared bakery savoury and sauce components

O-B01 Family bread dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 186-212.

Pilot input 1,715 g; target usable output 1,700 g. Planning production batch is x5: input 8,575 g and usable output 8,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	600	3,000	60.00%
Sugar	50	250	5.00%
Margarine	35	175	3.50%
Salt	18	90	1.80%
Yeast	12	60	1.20%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Weigh ingredients. Reserve 30 g of the listed water; add only if the flour absorbs it. The stated yield assumes all 600 g is used.

2. Mix flour, water, sugar and yeast about 3 minutes at low speed. Add salt, then mix 4–7 minutes at the mixer’s dough-development speed. Add margarine during the final 2 minutes. Stop at a thin elastic window and a dough temperature near 26–28°C.

3. Rest covered 15 minutes. Divide, pre-round, rest 10 minutes, then mould and tin as specified on the product card.

4. Trial proof at 30–35°C with enough humidity to prevent skinning, approximately 45–75 minutes. Bake when a gentle indentation returns slowly; do not use the clock alone.

Yield and process note: Input 1,715 g; allow 15 g bowl/handling loss. Improver omitted by owner instruction; do not add it to this version.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	58.31
Water	34.99
Sugar	2.92
Margarine	2.04
Salt	1.05
Yeast	0.70

Total-formula basis: 1,715.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	600.00	UNPRICED	UNPRICED
Sugar	50.00	640.00	32.00
Margarine	35.00	1,333.33	46.67
Salt	18.00	194.44	3.50
Yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **522.17 FCFA per pilot**. Unpriced or unresolved inputs: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B02 Condensed milk bun dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 213-243.

Pilot input 1,895 g; target usable output 1,870 g. Planning production batch is x5: input 9,475 g and usable output 9,350 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	430	2,150	43.00%
Condensed milk	150	750	15.00%
Sugar	80	400	8.00%
Egg	100	500	10.00%
Margarine	80	400	8.00%
Whole milk powder	20	100	2.00%
Salt	16	80	1.60%
Yeast	15	75	1.50%
Vanilla	4	20	0.40%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Dissolve condensed milk in water. Mix with flour, sugar, milk powder, yeast and egg on low for 3 minutes; reserve 25 g water until dough consistency is clear.

2. Add salt, develop 4–6 minutes, then add margarine gradually and mix another 2–4 minutes to an elastic film. Target 26–28°C dough; stop before overheating.

3. Rest covered 15 minutes. Portion and round with a tight surface; use the product card for bun weights.

4. Proof around 30–35°C for approximately 50–80 minutes until light and a gentle indentation returns slowly.

Yield and process note: Input 1,895 g; 25 g handling allowance. Egg wash is listed separately on the product card.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	52.77
Water	22.69
Condensed milk	7.92
Sugar	4.22
Egg	5.28
Margarine	4.22
Whole milk powder	1.06
Salt	0.84
Yeast	0.79
Vanilla	0.21

Total-formula basis: 1,895.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

O-B03 Sweet potato milk bread dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 244-273.

Pilot input 1,812 g; target usable output 1,790 g. Planning production batch is x5: input 9,060 g and usable output 8,950 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	850	4,250	85.00%
Sweet potato flour	150	750	15.00%
Water	570	2,850	57.00%
Condensed milk	100	500	10.00%
Sugar	40	200	4.00%
Margarine	50	250	5.00%
Whole milk powder	20	100	2.00%
Salt	18	90	1.80%
Yeast	14	70	1.40%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Blend the two flours thoroughly; baker’s percentages use their combined 1,000 g. Reserve 40 g water for absorption adjustment.

2. Mix all except margarine for 3 minutes slowly, then develop 5–8 minutes. Add margarine and mix until extensible. Expect a less strong window than wheat-only bread; excessive mixing will not restore absent gluten.

3. Rest 15 minutes, divide and mould gently. Proof around 30–33°C to a resilient loaf, stopping before the surface weakens.

4. Use the product card for baking. Record actual loaf volume, sweetness and day-of-sale softness before increasing sweet potato flour.

Yield and process note: Input 1,812 g; 22 g handling allowance. Start at 15% sweet potato flour, not an untested high replacement ratio.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	46.91
Sweet potato flour	8.28
Water	31.46
Condensed milk	5.52
Sugar	2.21
Margarine	2.76
Whole milk powder	1.10
Salt	0.99
Yeast	0.77

Total-formula basis: 1,812.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B04 Yeast doughnut dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 274-304.

Pilot input 1,808 g; target usable output 1,780 g. Planning production batch is x5: input 9,040 g and usable output 8,900 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	440	2,200	44.00%
Egg	100	500	10.00%
Sugar	120	600	12.00%
Margarine	80	400	8.00%
Whole milk powder	30	150	3.00%
Salt	15	75	1.50%
Yeast	18	90	1.80%
Nutmeg	2	10	0.20%
Vanilla	3	15	0.30%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour, water, egg, sugar, milk powder and yeast 3 minutes slowly. Add salt and mix 4–6 minutes; finish by incorporating margarine, nutmeg and vanilla.

2. Stop at elastic dough near 26–28°C. Rest covered 15 minutes; weigh individual pieces instead of repeatedly rerolling scraps.

3. Round or form rings; proof around 30°C for approximately 40–65 minutes until light, not fragile. Uncover only briefly to make transfer manageable.

4. Fry as specified on the product card; use a thermometer and allow oil temperature to recover between loads.

Yield and process note: Input 1,808 g; 28 g handling allowance. No filling is included.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	55.31
Water	24.34

O-B05 Puff puff batter

Status: Harmonized source formulation — production trial required

Source: S163; lines 305-331.

Pilot input 1,846 g; target usable output 1,830 g. Planning production batch is x5: input 9,230 g and usable output 9,150 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	100.00%
Water	700	3,500	70.00%
Sugar	120	600	12.00%
Salt	12	60	1.20%
Yeast	12	60	1.20%
Nutmeg	2	10	0.20%

Baker's percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix dry ingredients, then add water and beat 4–6 minutes to a cohesive sticky batter without dry flour.

2. Cover and ferment near 26–30°C for approximately 45–75 minutes, until bubbly and substantially expanded. Stir once gently if bubbles are very uneven.

3. Use a calibrated scoop to deliver 30 g portions. Trial fry one piece before loading the fryer.

4. Fry at 165–175°C, turning for even colour and checking the centre is set, typically 4–6 minutes depending on size.

Yield and process note: Input 1,846 g; 16 g bowl loss. Fermentation time is conditional on temperature.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	54.17
Water	37.92
Sugar	6.50
Salt	0.65
Yeast	0.65
Nutmeg	0.11

Total-formula basis: 1,846.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Plain flour	1,000.00	UNPRICED	UNPRICED
Water	700.00	UNPRICED	UNPRICED
Sugar	120.00	640.00	76.80
Salt	12.00	194.44	2.33
Yeast	12.00	1,666.67	20.00
Nutmeg	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **99.13 FCFA per pilot**. Unpriced or unresolved inputs: Nutmeg, Plain flour, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B06 Fish roll dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 332-360.

Pilot input 1,679 g; target usable output 1,660 g. Planning production batch is x5: input 8,395 g and usable output 8,300 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	100.00%
Water	470	2,350	47.00%
Margarine	100	500	10.00%
Sugar	60	300	6.00%
Whole milk powder	20	100	2.00%
Salt	15	75	1.50%
Yeast	12	60	1.20%
Nutmeg	2	10	0.20%

Baker's percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour, sugar, powder, yeast and water on low for 3 minutes. Add salt, margarine and nutmeg; mix another 4–6 minutes until smooth, with moderate gluten development.

2. Rest covered 20 minutes. Divide and roll as specified, without making the wrapper excessively thick.

3. Use fully chilled filling; seal clean dough edges firmly, with no filling trapped in the seam.

4. Rest assembled rolls 15–25 minutes before frying. They should be slightly aerated rather than fully doubled.

Yield and process note: Input 1,679 g; 19 g handling loss.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	59.56
Water	27.99
Margarine	5.96
Sugar	3.57
Whole milk powder	1.19
Salt	0.89
Yeast	0.71
Nutmeg	0.12

Total-formula basis: 1,679.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B07 Shortcrust pie pastry

Status: Harmonized source formulation — production trial required

Source: S163; lines 361-387.

Pilot input 1,773 g; target usable output 1,740 g. Planning production batch is x5: input 8,865 g and usable output 8,700 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	100.00%
Margarine	400	2,000	40.00%
Water	290	1,450	29.00%
Egg	60	300	6.00%
Salt	15	75	1.50%
Baking powder	8	40	0.80%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Keep fat and water cool. Mix flour, salt and baking powder; rub in margarine to coarse crumbs.

2. Add egg and most of the water. Fold just until cohesive; add the remainder only if needed. Do not develop a bread-like gluten network.

3. Cover and refrigerate 30–45 minutes. Roll to about 3 mm on a lightly floured surface.

4. Weigh cut portions, use chilled filling and seal. Rework clean trimmings only once; include any additional scrap in the recorded yield loss.

Yield and process note: Input 1,773 g; 33 g planned trimming/bowl loss after limited rework. Dusting flour must be recorded if material.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	56.40
Margarine	22.56
Water	16.36
Egg	3.38
Salt	0.85
Baking powder	0.45

Total-formula basis: 1,773.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B08 Fish filling

Status: Harmonized source formulation — production trial required

Source: S163; lines 388-415.

Pilot input 783 g; target usable output 700 g. Planning production batch is x5: input 3,915 g and usable output 3,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Canned fish drained	500	2,500	—
Onion trimmed	150	750	—
Carrot trimmed	80	400	—
Oil	25	125	—
Garlic peeled	10	50	—
Ginger peeled	8	40	—
Salt	5	25	—
Black pepper	2	10	—
Paprika	3	15	—

1. Check fish for bones. Weigh drained edible fish; the cost input is per drained kilogram, not unopened-can weight.

2. Soften finely chopped onion and carrot in oil 5–7 minutes. Add garlic, ginger and spices, then fish.

3. Cook while stirring until cohesive and fairly dry. Weigh the finished filling; target 700 g, with no free liquid.

4. Spread in shallow pans and actively cool under control C01–C05. Chill before filling dough; never leave a large warm pot on a counter.

Yield and process note: Input 783 g; target 700 g after evaporation. If yield differs, recompute cost per gram.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Canned fish drained	63.86
Onion trimmed	19.16
Carrot trimmed	10.22
Oil	3.19
Garlic peeled	1.28
Ginger peeled	1.02
Salt	0.64
Black pepper	0.26
Paprika	0.38

Total-formula basis: 783.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B09 Beef pie filling

Status: Harmonized source formulation — production trial required

Source: S163; lines 416-447.

Pilot input 1,506 g; target usable output 1,300 g. Planning production batch is x5: input 7,530 g and usable output 6,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Beef mince	500	2,500	—
Potato peeled	300	1,500	—
Carrot trimmed	150	750	—
Onion trimmed	200	1,000	—
Oil	30	150	—
Plain flour	35	175	—
Water	250	1,250	—
Garlic peeled	12	60	—
Ginger peeled	8	40	—
Salt	12	60	—
Black pepper	3	15	—
Thyme	2	10	—
Curry powder	4	20	—

1. Dice vegetables to about 5 mm. Brown beef in oil, breaking lumps; cook onion, garlic and ginger with it.

2. Add potato, carrot, seasonings and water. Simmer until vegetables soften; stir in flour dispersed in a little reserved water.

3. Cook until thick without raw flour taste and verify ground-meat control C01–C05. Target 1,300 g finished filling; reduce gently if wet.

4. Rapidly cool in shallow pans under C01–C05, cover after cooling and refrigerate. Use cold in pastry.

Yield and process note: Input 1,506 g; 206 g expected evaporation. Do not top up with cold untreated liquid after cooking.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Beef mince	33.20
Potato peeled	19.92

O-B10 Sausage roll filling

Status: Harmonized source formulation — production trial required

Source: S163; lines 448-474.

Pilot input 1,000 g; target usable output 980 g. Planning production batch is x5: input 5,000 g and usable output 4,900 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Sausage meat	750	3,750	—
Onion trimmed	100	500	—
Breadcrumbs	70	350	—
Egg	60	300	—
Garlic peeled	10	50	—
Black pepper	2	10	—
Paprika	3	15	—
Salt	5	25	—

1. Use chilled food-grade sausage meat; verify species and allergens with supplier. Reduce the added salt if the supplied meat is already strongly seasoned.

2. Finely mince onion and garlic, then combine all ingredients just until evenly distributed.

3. Keep covered and cold; portion 40 g cylinders for assembly. Keep raw-meat tools away from cooked products.

4. Cook fully inside pastry according to C01–C05; oven colour alone does not establish meat safety.

Yield and process note: Input 1,000 g; 20 g handling loss. Yield is raw filling; cooking loss is applied in the product card.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Sausage meat	75.00
Onion trimmed	10.00
Breadcrumbs	7.00
Egg	6.00
Garlic peeled	1.00
Black pepper	0.20
Paprika	0.30
Salt	0.50

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

O-B11 Creamy chicken filling

Status: Harmonized source formulation — production trial required

Source: S163; lines 475-506.

Pilot input 1,502 g; target usable output 1,300 g. Planning production batch is x5: input 7,510 g and usable output 6,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Chicken boneless	600	3,000	—
Potato peeled	150	750	—
Carrot trimmed	100	500	—
Onion trimmed	120	600	—
Pepper trimmed	80	400	—
Margarine	30	150	—
Plain flour	45	225	—
UHT milk	250	1,250	—
Water	100	500	—
Garlic peeled	10	50	—
Salt	12	60	—
Black pepper	3	15	—
Thyme	2	10	—

1. Dice raw boneless chicken separately from vegetables. Cook chicken thoroughly under C01–C05, then chop with cleaned utensils.

2. Soften onion, potato, carrot and pepper in margarine. Add garlic and flour; cook briefly, then gradually stir in milk and water.

3. Add cooked chicken and seasonings; simmer to a thick spoonable filling. Verify final centre temperature under C01–C05; target 1,300 g.

4. Cool actively in shallow pans under C01–C05 and refrigerate. This is a refrigerated filling, not a room-temperature display food.

Yield and process note: Input 1,502 g; target 1,300 g cooked. Raw chicken cost and cooking loss are included.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Chicken boneless	39.95
Potato peeled	9.99
Carrot trimmed	6.66
Onion trimmed	7.99
Pepper trimmed	5.33
Margarine	2.00
Plain flour	3.00
UHT milk	16.64
Water	6.66
Garlic peeled	0.67
Salt	0.80
Black pepper	0.20
Thyme	0.13

Total-formula basis: 1,502.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Plain flour	45.00	UNPRICED	UNPRICED
UHT milk	250.00	UNPRICED	UNPRICED
Water	100.00	UNPRICED	UNPRICED
Garlic peeled	10.00	UNPRICED	UNPRICED
Salt	12.00	194.44	2.33
Black pepper	3.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Thyme	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **42.33 FCFA per pilot**. Unpriced or unresolved inputs: Black pepper, Carrot trimmed, Chicken boneless, Garlic peeled, Onion trimmed, Pepper trimmed, Plain flour, Potato peeled, Thyme, UHT milk, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B12 Egg roll dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 507-535.

Pilot input 1,674 g; target usable output 1,650 g. Planning production batch is x5: input 8,370 g and usable output 8,250 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	100.00%
Water	470	2,350	47.00%
Sugar	80	400	8.00%
Margarine	70	350	7.00%
Whole milk powder	25	125	2.50%
Salt	15	75	1.50%
Yeast	12	60	1.20%
Nutmeg	2	10	0.20%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour, water, sugar, powder and yeast 3 minutes slowly. Add salt and fat; mix another 5–7 minutes until smooth.

2. Rest covered 15 minutes. Weigh 100 g pieces and flatten evenly.

3. Enclose a fully cooked, chilled, peeled egg; eliminate air pockets and close the seam completely.

4. Proof assembled rolls 20–35 minutes until slightly expanded, then fry according to the product card.

Yield and process note: Input 1,674 g; 24 g handling loss. Hard-boiled egg is a separate component.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	59.74
Water	28.08
Sugar	4.78
Margarine	4.18
Whole milk powder	1.49
Salt	0.90
Yeast	0.72
Nutmeg	0.12

Total-formula basis: 1,674.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Plain flour	1,000.00	UNPRICED	UNPRICED
Water	470.00	UNPRICED	UNPRICED
Sugar	80.00	640.00	51.20
Margarine	70.00	1,333.33	93.33
Whole milk powder	25.00	UNPRICED	UNPRICED
Salt	15.00	194.44	2.92
Yeast	12.00	1,666.67	20.00
Nutmeg	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **167.45 FCFA per pilot**. Unpriced or unresolved inputs: Nutmeg, Plain flour, Water, Whole milk powder. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. O-B13 Hard boiled peeled eggs

Status: Harmonized source formulation — production trial required

Source: S163; lines 536-555.

Pilot input 1,000 g; target usable output 970 g. Planning production batch is x5: input 5,000 g and usable output 4,850 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Egg	1,000	5,000	—

1. The formula uses edible egg weight. Purchase intact eggs, keep shell-handling separate, and wash hands after handling.

2. Lower into boiling water, simmer until yolks and whites are fully set; a starting trial is 10–12 minutes for medium eggs, then verify by cutting a sample.

3. Cool rapidly in potable ice water, peel hygienically and refrigerate. Weigh peeled cooked yield.

4. Portion by actual egg size; the model uses 50 g peeled eggs. Do not store peeled eggs at ambient temperature.

Yield and process note: 970 g expected cooked edible yield from 1,000 g raw edible equivalent. Shell cost is already converted into the egg price input.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Egg	100.00

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. O-B14 Banana condensed milk cake batter

Status: Harmonized source formulation — production trial required

Source: S163; lines 556-585.

Pilot input 3,061 g; target usable output 3,010 g. Planning production batch is x5: input 15,305 g and usable output 15,050 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	—
Banana peeled	900	4,500	—
Egg	400	2,000	—
Oil	300	1,500	—
Sugar	220	1,100	—
Condensed milk	200	1,000	—
Baking powder	20	100	—
Baking soda	5	25	—
Salt	8	40	—
Vanilla	5	25	—
Cinnamon	3	15	—

1. Mash sound ripe peeled bananas. Discard mouldy or fermented fruit; ripeness is not permission to use spoilage.

2. Whisk egg, sugar, condensed milk and oil, then banana. Sift flour, raising agents, salt and cinnamon together.

3. Fold dry into wet just until no dry flour remains. Deposit promptly into lined tins.

4. Bake under the product card. Do not leave mixed batter waiting while another oven load finishes.

Yield and process note: Input 3,061 g; 51 g bowl loss. No peanut is included in the baseline.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	32.67
Banana peeled	29.40
Egg	13.07

O-B15 Pizza dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 586-612.

Pilot input 1,708 g; target usable output 1,690 g. Planning production batch is x5: input 8,540 g and usable output 8,450 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	620	3,100	62.00%
Salt	20	100	2.00%
Sugar	20	100	2.00%
Yeast	8	40	0.80%
Oil	40	200	4.00%

Baker's percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour, water, sugar and yeast 3 minutes slowly; add salt and develop 5–7 minutes. Add oil near the end.

2. Cover and ferment approximately 60–90 minutes at 24–27°C until aerated. Fold once if needed.

3. Divide into 150 g balls, rest covered 20–30 minutes, then stretch to 18–20 cm without flattening every bubble at the rim.

4. Top immediately before baking; use cooked chicken and chilled sauce, not raw poultry.

Yield and process note: Input 1,708 g; 18 g handling loss.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	58.55
Water	36.30
Salt	1.17

O-B16 Pizza tomato sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 613-639.

Pilot input 977 g; target usable output 750 g. Planning production batch is x5: input 4,885 g and usable output 3,750 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Tomato trimmed	800	4,000	—
Onion trimmed	100	500	—
Oil	30	150	—
Garlic peeled	15	75	—
Sugar	15	75	—
Salt	12	60	—
Oregano	3	15	—
Black pepper	2	10	—

1. Chop tomatoes and onions; soften onion and garlic in oil.

2. Add tomatoes, sugar and seasoning; simmer and stir until thick enough not to flood pizza dough.

3. Blend with sanitized equipment if a smooth sauce is wanted; finish at 750 g target yield.

4. Rapidly cool and refrigerate under C01–C05. Portion 40 g per pizza.

Yield and process note: Input 977 g; evaporation target 227 g. Tomato ripeness changes yield.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Tomato trimmed	81.88
Onion trimmed	10.24
Oil	3.07
Garlic peeled	1.54
Sugar	1.54
Salt	1.23
Oregano	0.31
Black pepper	0.20

Total-formula basis: 977.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B25 Burger buns

Status: Harmonized source formulation — production trial required

Source: S163; lines 640-668.

Pilot input 1,802 g; target usable output 1,580 g. Planning production batch is x5: input 9,010 g and usable output 7,900 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	540	2,700	54.00%
Egg	80	400	8.00%
Sugar	65	325	6.50%
Margarine	60	300	6.00%
Whole milk powder	25	125	2.50%
Salt	18	90	1.80%
Yeast	14	70	1.40%

Baker's percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour, water, egg, sugar, powder and yeast 3 minutes slowly; add salt and develop 5–7 minutes. Add margarine at the end.

2. Rest 15 minutes; divide into 18 pieces of 99 g before normal handling loss. Round, rest and flatten gently.

3. Proof around 30–35°C until light. Bake at a trial 185–195°C for 14–18 minutes; cool on racks.

4. Target 1,580 g baked buns, about eighteen 87 g buns. For costing the output below is corrected to cooked usable mass.

Yield and process note: Input 1,802 g. Cooked output 1,580 g includes handling and baking losses; no egg wash or sesame included.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	55.49
Water	29.97
Egg	4.44

O-B26 Cooked crispy chicken pieces

Status: Harmonized source formulation — production trial required

Source: S163; lines 669-698.

Pilot input 1,772 g; target usable output 1,150 g. Planning production batch is x5: input 8,860 g and usable output 5,750 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Chicken boneless	1,000	5,000	—
Yogurt plain	150	750	—
Water	100	500	—
Salt	16	80	—
Garlic peeled	15	75	—
Ginger peeled	10	50	—
Paprika	8	40	—
Black pepper	3	15	—
Plain flour	280	1,400	—
Corn starch	70	350	—
Oil	120	600	—

1. Cut chicken into even boneless portions. Marinate refrigerated with yogurt, water, 10 g salt, garlic and ginger for 4–8 hours.

2. Mix flour, starch, remaining salt, paprika and pepper. Coat drained chicken, dip only into a separate working portion of marinade, then coat again. Discard all raw-contact surplus.

3. Fry in small loads at a trial 170–175°C, roughly 5–8 minutes for flattened pieces, until the thickest part meets C01–C05 poultry temperature.

4. Drain on a rack; weigh the cooked coated output. Target 1,150 g saleable product including coating. Service is immediate or controlled hot holding.

Yield and process note: Gross input includes excess coating, discarded marinade and 120 g frying-oil allowance. All are charged; 1,150 g output is a trial yield, not an absorption guarantee.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Chicken boneless	56.43
Yogurt plain	8.47
Water	5.64
Salt	0.90
Garlic peeled	0.85
Ginger peeled	0.56
Paprika	0.45
Black pepper	0.17
Plain flour	15.80

Total-formula basis: 1,772.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Chicken boneless	1,000.00	UNPRICED	UNPRICED
Yogurt plain	150.00	UNPRICED	UNPRICED
Water	100.00	UNPRICED	UNPRICED
Salt	16.00	194.44	3.11
Garlic peeled	15.00	UNPRICED	UNPRICED
Ginger peeled	10.00	UNPRICED	UNPRICED
Paprika	8.00	UNPRICED	UNPRICED
Black pepper	3.00	UNPRICED	UNPRICED
Plain flour	280.00	UNPRICED	UNPRICED
Corn starch	70.00	UNPRICED	UNPRICED
Oil	120.00	1,413.04	169.57

Known ingredient subtotal: **172.68 FCFA per pilot**. Unpriced or unresolved inputs: Black pepper, Chicken boneless, Corn starch, Garlic peeled, Ginger peeled, Paprika, Plain flour, Water, Yogurt plain. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B27 Cooked beef burger patties

Status: Harmonized source formulation — production trial required

Source: S163; lines 699-724.

Preparation-ahead option: chapter 6 gives the full oven, cooling, portioning and reheating method. Its final-yield adjustments apply when this base is cooked, chilled and reheated.

Pilot input 1,028 g; target usable output 750 g. Planning production batch is x5: input 5,140 g and usable output 3,750 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Beef mince	1,000	5,000	—
Salt	12	60	—
Black pepper	3	15	—
Paprika	3	15	—
Oil	10	50	—

1. Use mince with supplier-confirmed fat content, provisionally 15–20%. Keep chilled; do not add water or breadcrumbs.

2. Mix seasoning briefly, portion ten raw patties of approximately 102 g and make a shallow centre depression.

3. Cook on a lightly oiled hot plate, turning as needed, until the centre reaches the C01–C05 ground-beef limit. Probe from the side into the thickest centre.

4. Target ten 75 g cooked patties; weigh actual yield. Assemble immediately or hold under C01–C05.

Yield and process note: Input 1,028 g; cooked yield 750 g. Oil includes pan-use allowance.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Beef mince	97.28
Salt	1.17
Black pepper	0.29
Paprika	0.29
Oil	0.97

Total-formula basis: 1,028.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

O-B28 Burger sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 725-748.

Pilot input 983 g; target usable output 975 g. Planning production batch is x5: input 4,915 g and usable output 4,875 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Mayonnaise pasteurized	650	3,250	—
Ketchup	220	1,100	—
Mustard	50	250	—
O-B23 Refrigerator cucumber pickles	60	300	—
Paprika	3	15	—

1. Finely chop drained O-B23 pickles. Combine with pasteurized mayonnaise, ketchup, mustard and paprika.

2. Mix with sanitized utensils and portion into small clean service containers.

3. Label and refrigerate under C01–C05; replace containers instead of topping up.

4. Use 25 g per burger and record remaining sauce at service close.

Yield and process note: Input 983 g; 8 g bowl loss. Mustard, egg and other supplier-declared allergens may apply.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Mayonnaise pasteurized	66.12
Ketchup	22.38
Mustard	5.09
O-B23 Refrigerator cucumber pickles	6.10
Paprika	0.31

Total-formula basis: 983.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

O-B29 Samosa wrapper dough

Status: Harmonized source formulation — production trial required

Source: S163; lines 749-773.

Pilot input 1,538 g; target usable output 1,510 g. Planning production batch is x5: input 7,690 g and usable output 7,550 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	1,000	5,000	100.00%
Water	460	2,300	46.00%
Oil	60	300	6.00%
Salt	18	90	1.80%

Baker's percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix flour and salt with oil, then add water to make a firm smooth dough. Knead 5–7 minutes.

2. Cover and rest 30 minutes. Divide 30 g portions and roll thinly into circles; cut/fold into cones as preferred.

3. Make sealing paste from O-B30; fill with 40 g chilled O-B31 and exclude trapped air.

4. Seal all seams completely and fry promptly in small batches as specified on the product card.

Yield and process note: Input 1,538 g; 28 g handling/trimming loss. No yeast.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	65.02
Water	29.91
Oil	3.90
Salt	1.17

Total-formula basis: 1,538.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B30 Samosa sealing paste

Status: Harmonized source formulation — production trial required

Source: S163; lines 774-794.

Pilot input 100 g; target usable output 98 g. Planning production batch is x5: input 500 g and usable output 490 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	40	200	—
Water	60	300	—

1. Whisk water into flour to a thick smooth paste.

2. Prepare a small quantity for one assembly session; keep covered and cool.

3. Apply 2 g to each seam; cook the sealed pastry thoroughly.

4. Discard the working remainder after assembly; never use it as a ready-to-eat sauce.

Yield and process note: Input 100 g; 2 g bowl loss.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	40.00
Water	60.00

Total-formula basis: 100.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

O-B31 Chicken vegetable samosa filling

Status: Harmonized source formulation — production trial required

Source: S163; lines 795-824.

Pilot input 1,141 g; target usable output 1,000 g. Planning production batch is x5: input 5,705 g and usable output 5,000 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Chicken boneless	350	1,750	—
Potato peeled	350	1,750	—
Carrot trimmed	120	600	—
Onion trimmed	150	750	—
Oil	30	150	—
Water	100	500	—
Garlic peeled	10	50	—
Ginger peeled	10	50	—
Salt	12	60	—
Curry powder	6	30	—
Cumin	3	15	—

1. Cook finely diced chicken thoroughly under C01–C05 using separate raw-meat utensils.

2. Soften onion, garlic and ginger in oil; add diced potato, carrot and water, then simmer until tender.

3. Fold in chicken and seasonings; cook to a dry filling and target 1,000 g cooked mass.

4. Rapidly cool in shallow trays under C01–C05; use cold at 40 g per samosa.

Yield and process note: Input 1,141 g; target 1,000 g after cooking.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Chicken boneless	30.67
Potato peeled	30.67
Carrot trimmed	10.52
Onion trimmed	13.15
Oil	2.63
Water	8.76
Garlic peeled	0.88
Ginger peeled	0.88
Salt	1.05
Curry powder	0.53
Cumin	0.26

O-B32 Milk cake sponge: batter to baked component

Status: Harmonized source formulation — production trial required

Source: S163; lines 825-851.

Pilot input 1,105 g; target usable output 950 g. Planning production batch is x5: input 5,525 g and usable output 4,750 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	300	1,500	—
Egg	450	2,250	—
Sugar	220	1,100	—
UHT milk	80	400	—
Oil	40	200	—
Baking powder	8	40	—
Salt	3	15	—
Vanilla	4	20	—

1. Whip eggs and sugar in the mixing machine 6–10 minutes until thick and ribboning; use a clean bowl.

2. Sift flour, baking powder and salt. Fold into the foam gently, then fold in milk, oil and vanilla pre-mixed with a little batter.

3. Deposit into a lined shallow pan. Bake at a trial 170–180°C for 22–30 minutes until springy with no wet batter on a skewer.

4. Cool the sponge on a rack, then weigh. Target 950 g baked sponge; do not soak warm cake and leave it unrefrigerated.

Yield and process note: Input 1,105 g; about 25 g bowl and 130 g bake loss. Output used for costing is 950 g baked sponge.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	27.15
Egg	40.72
Sugar	19.91
UHT milk	7.24
Oil	3.62
Baking powder	0.72
Salt	0.27
Vanilla	0.36

Total-formula basis: 1,105.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. O-B33 Three milk soak

Status: Harmonized source formulation — production trial required

Source: S163; lines 852-873.

Pilot input 1,000 g; target usable output 990 g. Planning production batch is x5: input 5,000 g and usable output 4,950 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Condensed milk	400	2,000	—
UHT milk	400	2,000	—
Cream 35%	200	1,000	—

1. Mix cold pasteurized/UHT dairy in a sanitized jug.

2. Keep refrigerated; weigh the amount applied to each fully cooled sponge.

3. Use 800 g soak per 950 g O-B32 sponge and allow absorption under refrigeration.

4. Do not reuse liquid drained from a cake or serving tray.

Yield and process note: Input 1,000 g; 10 g handling loss. A full base leaves 190 g when one full O-B32 sponge is soaked.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Condensed milk	40.00
UHT milk	40.00
Cream 35%	20.00

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Butter	20	100	—
Water	20	100	—
Vanilla	2	10	—

1. Melt butter gently. Stir into condensed milk with sifted icing sugar and vanilla.

2. Add potable water gradually to the measured consistency; use all listed water for the model yield.

3. Apply a thin measured layer to products; prepare only the quantity needed for the session.

4. Treat the diluted glaze and glazed goods under refrigerated control C01–C05 unless a competent assessment validates another holding method.

Yield and process note: Input 342 g; 7 g bowl loss. No ambient shelf-life claim.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Condensed milk	58.48
Icing sugar	29.24
Butter	5.85
Water	5.85
Vanilla	0.58

Total-formula basis: 342.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Condensed milk	200.00	UNPRICED	UNPRICED
Icing sugar	100.00	UNPRICED	UNPRICED
Butter	20.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Water	20.00	UNPRICED	UNPRICED
Vanilla	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **0.00 FCFA per pilot**. Unpriced or unresolved inputs: Butter, Condensed milk, Icing sugar, Vanilla, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B17 Shawarma flatbread

Status: Harmonized source formulation — production trial required

Source: S163; lines 898-924.

Pilot input 1,681 g; target usable output 1,500 g. Planning production batch is x5: input 8,405 g and usable output 7,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Bread flour	1,000	5,000	100.00%
Water	610	3,050	61.00%
Sugar	15	75	1.50%
Salt	18	90	1.80%
Yeast	8	40	0.80%
Oil	30	150	3.00%

Baker’s percentages use 1,000 g total flour as 100%; added milk/egg/fat are weighed ingredients, not equivalent to water.

1. Mix all ingredients 3 minutes slowly then 5–7 minutes until smooth and extensible.

2. Rest covered 30 minutes, divide into sixteen pieces of about 104 g, then rest another 15 minutes.

3. Roll each evenly to about 24–26 cm. Cook on a very hot clean plate or in a 240–260°C trial oven until set and just blistered, roughly 1–3 minutes; avoid crisping.

4. Stack briefly under a clean cover to retain flexibility, then cool without condensation. Target 1,500 g cooked bread; sixteen wraps at 90 g consume 1,440 g.

Yield and process note: Input 1,681 g; allow about 17 g handling and 164 g baking loss. Extra 60 g cooked bread is allocated to QC/weight variation in product costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	59.49
Water	36.29
Sugar	0.89
Salt	1.07
Yeast	0.48
Oil	1.78

Total-formula basis: 1,681.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

O-B18 Cooked chicken shawarma meat

Status: Harmonized source formulation — production trial required

Source: S163; lines 925-958.

Preparation-ahead option: chapter 6 gives the full oven, cooling, portioning and reheating method. Its final-yield adjustments apply when this base is cooked, chilled and reheated.

Pilot input 1,304 g; target usable output 750 g. Planning production batch is x5: input 6,520 g and usable output 3,750 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Chicken boneless	1,000	5,000	—
Yogurt plain	150	750	—
Lemon juice	35	175	—
Vinegar 5%	15	75	—
Oil	30	150	—
Garlic peeled	25	125	—
Salt	16	80	—
Paprika	12	60	—
Cumin	6	30	—
Coriander	6	30	—
Black pepper	3	15	—
Cinnamon	1	5	—
Chili trimmed	5	25	—

1. Use trimmed boneless thigh; keep raw meat at or below 4°C. Mix marinade separately, coat meat, cover, label and marinate refrigerated 6–12 hours as a trial quality window.

2. Drain only excess free marinade. Weigh the raw load. Use the vertical machine only once its minimum cone size and safe operating instructions are established; otherwise cook small batches on a suitable hot plate.

3. Follow the dedicated shawarma service workflow in chapter 6. Shave only the cooked outer layer, then finish slices on the griddle and probe to C01–C05 poultry temperature.

4. Target 750 g saleable cooked meat per 1,000 g purchased boneless meat. All marinade cost is charged even though some is discarded. Never reuse raw marinade as sauce.

Yield and process note: Gross input 1,304 g including marinade; 750 g cooked saleable output is an assumed purchase-to-cooked yield of 75%, not 75% of the marinated total.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Chicken boneless	76.69
Yogurt plain	11.50
Lemon juice	2.68
Vinegar 5%	1.15
Oil	2.30
Garlic peeled	1.92
Salt	1.23

O-B19 Cooked beef shawarma meat

Status: Harmonized source formulation — production trial required

Source: S163; lines 959-991.

Preparation-ahead option: chapter 6 gives the full oven, cooling, portioning and reheating method. Its final-yield adjustments apply when this base is cooked, chilled and reheated.

Pilot input 1,231 g; target usable output 700 g. Planning production batch is x5: input 6,155 g and usable output 3,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Beef boneless	1,000	5,000	—
Onion trimmed	80	400	—
Lemon juice	30	150	—
Vinegar 5%	30	150	—
Oil	30	150	—
Garlic peeled	20	100	—
Salt	16	80	—
Paprika	10	50	—
Cumin	6	30	—
Coriander	5	25	—
Black pepper	3	15	—
Cinnamon	1	5	—

1. Thinly slice trimmed beef across the grain. Combine marinade and coat in a covered food-safe container.

2. Marinate refrigerated 6–12 hours as a pilot quality window. Do not add more acid to tenderize an unsuitable tough cut indefinitely.

3. Cook using the same staged shawarma workflow as chicken; finish shaved slices thoroughly under C01–C05's shawarma house standard.

4. Target 700 g cooked saleable beef per kilogram purchased boneless meat; record actual yield and discard raw marinade.

Yield and process note: Gross input 1,231 g; cooked saleable yield assumes 70% of raw purchased beef. It is a costing assumption, not a guaranteed yield.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Beef boneless	81.23
Onion trimmed	6.50
Lemon juice	2.44

O-B20 Garlic mayonnaise sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 992-1016.

Pilot input 987 g; target usable output 975 g. Planning production batch is x5: input 4,935 g and usable output 4,875 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Mayonnaise pasteurized	800	4,000	—
Lemon juice	65	325	—
Water	65	325	—
Garlic peeled	50	250	—
Salt	5	25	—
Black pepper	2	10	—

1. Use commercial pasteurized mayonnaise; do not prepare a raw-egg mayonnaise.

2. Blend garlic with lemon and water using sanitized tools, then whisk into mayonnaise and season.

3. Weigh and fill small covered service bottles; label and refrigerate under C01–C05.

4. Use a clean bottle for each replenishment rather than topping fresh sauce into old sauce.

Yield and process note: Input 987 g; 12 g bowl loss. Water and garlic addition invalidate the original unopened mayonnaise shelf life.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Mayonnaise pasteurized	81.05
Lemon juice	6.59
Water	6.59
Garlic peeled	5.07
Salt	0.51
Black pepper	0.20

Total-formula basis: 987.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B21 Cooked hot sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 1017-1043.

Pilot input 880 g; target usable output 700 g. Planning production batch is x5: input 4,400 g and usable output 3,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Tomato trimmed	500	2,500	—
Chili trimmed	120	600	—
Onion trimmed	100	500	—
Garlic peeled	20	100	—
Vinegar 5%	80	400	—
Oil	30	150	—
Sugar	20	100	—
Salt	10	50	—

1. Soften onion and garlic in oil, add chopped tomato, chili, vinegar, sugar and salt.

2. Simmer 15–20 minutes, blend safely and return to a bubbling simmer; reduce to 700 g.

3. Cool actively under C01–C05, bottle hygienically and refrigerate.

4. Offer a measured 5 g serving separately to let customers choose heat.

Yield and process note: Input 880 g; 180 g evaporation. This is not a shelf-stable bottled sauce; acidity is unvalidated.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Tomato trimmed	56.82
Chili trimmed	13.64
Onion trimmed	11.36
Garlic peeled	2.27
Vinegar 5%	9.09
Oil	3.41
Sugar	2.27
Salt	1.14

Total-formula basis: 880.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-B22 Shawarma slaw

Status: Harmonized source formulation — production trial required

Source: S163; lines 1044-1068.

Pilot input 995 g; target usable output 975 g. Planning production batch is x5: input 4,975 g and usable output 4,875 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Cabbage trimmed	700	3,500	—
Carrot trimmed	180	900	—
Onion trimmed	60	300	—
Vinegar 5%	35	175	—
Sugar	15	75	—
Salt	5	25	—

1. Wash trimmed vegetables with potable water and use sanitized ready-to-eat preparation tools.

2. Shred finely, mix dressing, toss and drain excess free liquid briefly.

3. Weigh finished yield and chill covered. Portion only small quantities onto the service line.

4. Serve 45 g per wrap. Keep separate from raw poultry, its containers and its wash area.

Yield and process note: Input 995 g; 20 g draining/handling loss. Vinegar does not replace refrigeration.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Cabbage trimmed	70.35
Carrot trimmed	18.09
Onion trimmed	6.03
Vinegar 5%	3.52
Sugar	1.51
Salt	0.50

Total-formula basis: 995.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

O-B23 Refrigerator cucumber pickles

Status: Harmonized source formulation — production trial required

Source: S163; lines 1069-1092.

Pilot input 1,480 g; target usable output 650 g. Planning production batch is x5: input 7,400 g and usable output 3,250 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Cucumber trimmed	700	3,500	—
Vinegar 5%	350	1,750	—
Water	350	1,750	—
Sugar	60	300	—
Salt	20	100	—

1. Dissolve sugar and salt in the water with heat, add vinegar, and cool the brine rapidly before adding clean sliced cucumber.

2. Submerge in a clean covered food-safe container and refrigerate overnight for flavour.

3. Drain only the service quantity; target 650 g drained cucumber from the batch. Brine is discarded and fully charged to cost.

4. Label as refrigerated quick pickles. No ambient-storage or canning claim is made.

Yield and process note: Gross input 1,480 g including brine. Only drained pickles are costed as usable output.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Cucumber trimmed	47.30
Vinegar 5%	23.65
Water	23.65
Sugar	4.05
Salt	1.35

Total-formula basis: 1,480.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Cucumber trimmed	700.00	UNPRICED	UNPRICED
Vinegar 5%	350.00	UNPRICED	UNPRICED
Water	350.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Sugar	60.00	640.00	38.40
Salt	20.00	194.44	3.89

Known ingredient subtotal: **42.29 FCFA per pilot**. Unpriced or unresolved inputs: Cucumber trimmed, Vinegar 5%, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-B24 Crisp fries

Status: Harmonized source formulation — production trial required

Source: S163; lines 1093-1114.

Pilot input 1,128 g; target usable output 650 g. Planning production batch is x5: input 5,640 g and usable output 3,250 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Potato peeled	1,000	5,000	—
Oil	120	600	—
Salt	8	40	—

1. Cut peeled potatoes to uniform 8–10 mm sticks. Rinse with potable water, drain and dry thoroughly away from hot oil.

2. For immediate service, trial a first fry around 150–160°C until cooked but pale, then finish around 175°C until crisp. Keep batches small.

3. Drain on a rack and salt. Serve promptly; do not hold a large tray at room temperature for later frying.

4. If par-frying in advance, use the controlled cooling and refrigerated storage workflow C01–C05, then finish to order.

Yield and process note: 650 g assumed saleable fries per kg peeled potato. Oil entry is a 120 g usage/disposal cost allowance, not a claim that all oil is absorbed. Cost the fryer charge separately as working stock.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Potato peeled	88.65
Oil	10.64
Salt	0.71

Total-formula basis: 1,128.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Potato peeled	1,000.00	UNPRICED	UNPRICED
Oil	120.00	1,413.04	169.57
Salt	8.00	194.44	1.56

Known ingredient subtotal: **171.12 FCFA per pilot**. Unpriced or unresolved inputs: Potato peeled. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

O-B35 Beef shawarma sesame sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 1115-1139.

Pilot input 990 g; target usable output 975 g. Planning production batch is x5: input 4,950 g and usable output 4,875 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Mayonnaise pasteurized	500	2,500	—
Tahini	200	1,000	—
Lemon juice	80	400	—
Water	180	900	—
Garlic peeled	25	125	—
Salt	5	25	—

1. Whisk tahini with lemon and water until smooth, then incorporate mayonnaise, garlic and salt.

2. Use sanitized utensils and check supplier sesame and egg allergen declarations.

3. Refrigerate in small labelled service bottles under C01–C05.

4. Portion 30 g per beef wrap; keep a separate spoon for sesame sauce.

Yield and process note: Input 990 g; 15 g handling loss. A garlic-only alternative uses O-B20 at the same serving mass; re-cost.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Mayonnaise pasteurized	50.51
Tahini	20.20
Lemon juice	8.08
Water	18.18
Garlic peeled	2.53
Salt	0.51

Total-formula basis: 990.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Repeat independently before scale-up.

O-B36 lemon-garlic oven fish

Status: Harmonized source formulation — production trial required

Source: S163; lines 1140-1164.

This is a new shared base for O-A02/O-A03. Use supplier-identified, food-grade, boneless tilapia or another firm white-fish fillet. The recipe is for trimmed edible fillet, not whole fish. Inspect carefully for pin bones before and after cooking. Keep fish utensils separate; fish is an additional allergen in the burger/wrap station.

Ingredient	Pilot g	Production trial g (×5)
Boneless trimmed white fish	1,000	5,000
Oil	25	125
Lemon juice	25	125
Garlic, finely crushed	15	75
Salt	10	50
Paprika	4	20
Black pepper	2	10
Total input	1,081	5,405

1. Keep fillets chilled, drain excess thaw water and pat with disposable food-safe towel. Cut pieces of similar thickness, roughly 15–20 mm; keep smaller pieces in a separate trial group. Mix the listed seasonings and oil, coat fish, and refrigerate for a short trial of 15–20 minutes. Acid does not make raw fish safe; extended lemon contact can soften it.

2. Place in a single layer in a lined raised-edge pan. Trial roast at 180–190°C, checking around 10–16 minutes; thickness and oven loading determine the actual duration. Meet C01–C05 at the thickest centre. Target moist flakes and light browning, with no raw centre. Inspect for remaining bones with clean utensils without breaking every piece unnecessarily.

3. For immediate service, portion after cooking and assemble. For preparation ahead, cool, portion and transport using the controlled route above. Trial reheating covered briefly to limit drying, then uncover if surface moisture needs removal; meet C01–C05 before assembly. Do not mix yesterday's fish with a new batch or use strongly deteriorated fish with extra spice.

4. Planning yield: 800 g chilled usable fish per pilot, then 760 g after a trial 95% reheating retention. These are unverified assumptions, not measured performance. Record cooking, chilling, trimming and reheating losses separately. At 120 g final fish, one pilot supports six sale portions and a 40 g final-equivalent balance; at 100 g, seven and a 60 g balance. Balances must have an identified same-day use or be charged as waste, not counted as full portions.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Boneless trimmed white fish	92.51
Oil	2.31
Lemon juice	2.31
Garlic, finely crushed	1.39
Salt	0.93
Paprika	0.37
Black pepper	0.19

Total-formula basis: 1,081.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

Bakery snacks and assembled meals

O-P01 Soft family bread

Status: Harmonized source formulation — production trial required

Source: S163; lines 1169-1198.

Quality target: Fine even crumb, thin golden crust, clean slices and a soft but fully baked centre.

Pilot: 3 saleable units. Planning production batch: 15 units. Portion: 3 x 550 g dough; about 470–495 g baked each. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B01 Family bread dough	1,700	8,500

1. Make O-B01. Weigh three 550 g dough pieces; the 50 g surplus covers QC/test dough and is charged to these loaves.

2. Pre-round, rest 10 minutes and mould into greased tins. Proof as O-B01; leave room for oven spring rather than overproofing to the tin edge.

3. Trial bake at 195–205°C for 25–32 minutes. Check a representative loaf centre near 94–96°C as a baking-quality cue, not a universal safety limit.

4. De-tin immediately. Cool on racks until no warmth/condensation remains before slicing and bagging. Verify cooled sale weight and slicing consistency.

Holding and packaging: A — Unfilled bread/plain fried snack: quality policy is sale on production day after protected cooling. No multi-day ambient safety claim. Keep clean, dry and protected; record discard or separately approved reuse. Adding dairy glaze/filling changes the class.

Troubleshooting: Dense crumb: insufficient proof/development; collapsed top: excessive proof or underbake; gummy slices: sliced too warm.

Substitution: Use the strongest consistent local wheat flour; re-trial water rather than assuming equal absorption.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B01 Family bread dough	100.00

Total-formula basis: 1,700.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B01 Family bread dough	1,700.00	307.16	522.17

Known ingredient subtotal: **522.17 FCFA per pilot**. Unpriced or unresolved inputs: O-B01: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 174.06 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 17.41 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P02 Condensed milk breakfast buns

Status: Harmonized source formulation — production trial required

Source: S163; lines 1199-1229.

Quality target: Rounded golden buns, shreddable soft crumb, clear milk aroma without a wet surface.

Pilot: 20 saleable units. Planning production batch: 100 units. Portion: 20 x 90 g dough; about 78–82 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B02 Condensed milk bun dough	1,870	9,350
Egg	40	200

1. Make O-B02 and portion twenty 90 g buns. Charge the remaining 70 g dough to QC/variation.

2. Round tightly, place with expansion space, proof using O-B02, then brush lightly with the 40 g weighed egg wash; discard unused raw-contact wash.

3. Bake at a trial 180–190°C for 14–18 minutes. Rotate only if safe and the oven's distribution test indicates a need.

4. Cool completely and bag. Start with plain buns; an optional 8 g O-B34 glaze adds refrigerated handling and additional cost, so it is excluded from baseline pricing.

Holding and packaging: A — Unfilled bread/plain fried snack: quality policy is sale on production day after protected cooling. No multi-day ambient safety claim. Keep clean, dry and protected; record discard or separately approved reuse. Adding dairy glaze/filling changes the class.

Troubleshooting: Tight crumb: add fat too early or underproof; very dark crust: excessive sugar or heat; wrinkling: underbaking.

Substitution: Budget trial: replace each 150 g condensed milk with 68 g sugar, 42 g whole milk powder and 40 g water; sensory and cost recheck required.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B02 Condensed milk bun dough	97.91
Egg	2.09

Total-formula basis: 1,910.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B02 Condensed milk bun dough	1,870.00	324.05	605.98
Egg	40.00	UNPRICED	UNPRICED

Known ingredient subtotal: **605.98 FCFA per pilot**. Unpriced or unresolved inputs: Egg, O-B02: Condensed milk, O-B02: Egg, O-B02: Vanilla, O-B02: Water, O-B02: Whole milk powder. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 30.30 FCFA for 20 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.03 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Repeat independently before scale-up.

O-P03 Nkambe sweet potato milk loaf

Status: Harmonized source formulation — production trial required

Source: S163; lines 1230-1259.

Quality target: Warm yellow/brown crumb depending on flour, mild sweetness and enough elasticity for clean slices.

Pilot: 3 saleable units. Planning production batch: 15 units. Portion: 3 x 580 g dough; about 495–522 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B03 Sweet potato milk bread dough	1,790	8,950

1. Make O-B03 using sound food-grade sweet potato flour. Divide three 580 g loaves; charge 50 g remaining dough to QC.

2. Mould gently, tin and proof to resilience; do not force the height of a wheat-only loaf.

3. Trial bake at 190–200°C for 27–33 minutes; verify fully baked centre and record cooled mass.

4. Cool and bag with an accurate ingredient description. Test this against O-P01 at two prices before committing a large daily volume.

Holding and packaging: A — Unfilled bread/plain fried snack: quality policy is sale on production day after protected cooling. No multi-day ambient safety claim. Keep clean, dry and protected; record discard or separately approved reuse. Adding dairy glaze/filling changes the class.

Troubleshooting: Low volume: weak flour or too much sweet potato; gummy interior: underbake/high water; gritty texture: coarse flour.

Substitution: If sweet potato flour is unavailable, sell O-P01 under its own name; cooked sweet potato puree is not a direct gram-for-gram substitute.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B03 Sweet potato milk bread dough	100.00

Total-formula basis: 1,790.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B03 Sweet potato milk bread dough	1,790.00	265.98	476.10

Known ingredient subtotal: **476.10 FCFA per pilot**. Unpriced or unresolved inputs: O-B03: Condensed milk, O-B03: Sweet potato flour, O-B03: Water, O-B03: Whole milk powder. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 158.70 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 15.87 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P04 Sugar ring doughnuts

Status: Harmonized source formulation — production trial required

Source: S163; lines 1260-1291.

Quality target: Light crumb, an even ring, thin sugar finish and no raw centre or greasy bite.

Pilot: 25 saleable units. Planning production batch: 125 units. Portion: 25 x 70 g dough; about 66–73 g finished with sugar. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B04 Yeast doughnut dough	1,780	8,900
Oil	200	1,000
Sugar	120	600

1. Prepare O-B04, portion twenty-five 70 g rings; 30 g spare dough is charged to QC.

2. Proof until light. Fry at 170–175°C about 60–100 seconds per side as a trial, adjusting to centre doneness and colour.

3. Drain on a rack; apply 120 g sugar across the batch. Oil entry is usage/disposal allocation, not 200 g guaranteed absorption.

4. Sell in small replenishment waves. Glazed variant: replace sugar dusting with 8 g O-B34 per unit and use refrigerated handling; do not hide its extra cost in this baseline.

Holding and packaging: A — Unfilled bread/plain fried snack: quality policy is sale on production day after protected cooling. No multi-day ambient safety claim. Keep clean, dry and protected; record discard or separately approved reuse. Adding dairy glaze/filling changes the class.

Troubleshooting: Dark/raw centre: oil too hot; oily heavy crumb: underproof or low oil recovery; collapse: overproof.

Substitution: Omit milk powder only after water/texture trials; do not substitute baking powder for yeast in this formula.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B04 Yeast doughnut dough	84.76
Oil	9.52
Sugar	5.71

Total-formula basis: 2,100.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B04 Yeast doughnut dough	1,780.00	357.52	636.38
Oil	200.00	1,413.04	282.61
Sugar	120.00	640.00	76.80

Known ingredient subtotal: **995.79 FCFA per pilot**. Unpriced or unresolved inputs: O-B04: Egg, O-B04: Nutmeg, O-B04: Vanilla, O-B04: Water, O-B04: Whole milk powder. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 39.83 FCFA for 25 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.98 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P05 Puff puff

Status: Harmonized source formulation — production trial required

Source: S163; lines 1292-1322.

Quality target: Rounded pieces with an aerated cooked centre, even colour and no sour overfermentation.

Pilot: 60 saleable units. Planning production batch: 300 units. Portion: 60 x 30 g raw portions; about 27–31 g fried. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B05 Puff puff batter	1,830	9,150
Oil	180	900

1. Make O-B05. Portion sixty 30 g scoops; the remaining 30 g is charged to trial pieces.

2. Fry at 165–175°C in small batches, turning until uniformly golden and the centre is fully set.

3. Drain and count; put five in a ventilated paper pack only when ordered. Do not seal steaming puff puff in plastic.

4. At the example price, a five-piece pack is 350–375 FCFA only if the discounted contribution remains acceptable.

Holding and packaging: A — Unfilled bread/plain fried snack: quality policy is sale on production day after protected cooling. No multi-day ambient safety claim. Keep clean, dry and protected; record discard or separately approved reuse. Adding dairy glaze/filling changes the class.

Troubleshooting: Flat pieces: thin or overfermented batter; hard centre: low hydration/underproof; oily finish: low oil recovery.

Substitution: Use a 25 g raw portion for a lower-price test only after recalculating yield and clearly preserving value.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B05 Puff puff batter	91.04
Oil	8.96

Total-formula basis: 2,010.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B05 Puff puff batter	1,830.00	54.17	99.13
Oil	180.00	1,413.04	254.35

Known ingredient subtotal: **353.48 FCFA per pilot**. Unpriced or unresolved inputs: O-B05: Nutmeg, O-B05: Plain flour, O-B05: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 5.89 FCFA for 60 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.59 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Repeat independently before scale-up.

O-P06 Cameroon style fish rolls

Status: Harmonized source formulation — production trial required

Source: S163; lines 1323-1354.

Quality target: Crisp golden exterior, rolled seam and a clearly present dry fish filling.

Pilot: 24 saleable units. Planning production batch: 120 units. Portion: 24 x 65 g dough + 25 g filling; about 82–88 g cooked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B06 Fish roll dough	1,660	8,300
O-B08 Fish filling	600	3,000
Oil	180	900

1. Make O-B06 and O-B08 separately. Use 1,560 g dough and 600 g cold filling for 24 rolls; 100 g dough is QC allowance. A full 700 g O-B08 batch leaves 100 g allocated separately.

2. Roll 65 g dough pieces, add 25 g filling, close edges and seam, then rest briefly as O-B06.

3. Fry at a trial 165–175°C until golden and filling is thoroughly reheated under C01–C05. Check the thickest sample.

4. Drain and use holding class H. Transport finished rolls hot under control; an alternative is chilled assembled uncooked rolls for final frying at the sales site under chapter 6. Do not chill finished rolls for a second reheating of the fish filling.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Burst seams: wet filling or poor seal; gummy spiral: wrapper too thick; fishy flavour: unsuitable fish/storage.

Substitution: Use cooked deboned fresh fish only with measured purchase-to-edible yield and revised cost.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B06 Fish roll dough	68.03
O-B08 Fish filling	24.59
Oil	7.38

Total-formula basis: 2,440.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B06 Fish roll dough	1,660.00	117.26	194.65
O-B08 Fish filling	600.00	51.85	31.11

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Oil	180.00	1,413.04	254.35

Known ingredient subtotal: **480.11 FCFA per pilot**. Unpriced or unresolved inputs: O-B06: Nutmeg, O-B06: Plain flour, O-B06: Water, O-B06: Whole milk powder, O-B08: Black pepper, O-B08: Canned fish drained, O-B08: Carrot trimmed, O-B08: Garlic peeled, O-B08: Ginger peeled, O-B08: Onion trimmed, O-B08: Paprika. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 20.00 FCFA for 24 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.00 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Fish Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Repeat independently before scale-up.

O-P07 Beef meat pies

Status: Harmonized source formulation — production trial required

Source: S163; lines 1355-1386.

Quality target: Short flaky bite, full corners, intact seal and visible beef/vegetable filling.

Pilot: 22 saleable units. Planning production batch: 110 units. Portion: 22 x 75 g pastry + 50 g filling; about 112–118 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B07 Shortcrust pie pastry	1,740	8,700
O-B09 Beef pie filling	1,100	5,500
Egg	45	225

1. Prepare O-B07 and O-B09. Cut twenty-two 75 g pastry portions and add 50 g chilled filling each. Pastry surplus is 90 g; full O-B09 yields 200 g unused filling.

2. Seal with clean edges, vent, brush using 45 g allocated egg wash and discard raw-contact leftovers.

3. Trial bake at 190–200°C for 22–28 minutes. Check base colour, pastry doneness and filling temperature under C01–C05.

4. Apply H holding and package without trapping excessive steam.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Tough pastry: overmixing; soggy base: wet/hot filling; leakage: overfilling or weak seam.

Substitution: Replace part of beef with potato only as a separately labelled economy formula with recalculated portions.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B07 Shortcrust pie pastry	60.31
O-B09 Beef pie filling	38.13
Egg	1.56

Total-formula basis: 2,885.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B07 Shortcrust pie pastry	1,740.00	308.19	536.25
O-B09 Beef pie filling	1,100.00	34.40	37.84
Egg	45.00	UNPRICED	UNPRICED

Known ingredient subtotal: **574.09 FCFA per pilot**. Unpriced or unresolved inputs: Egg, O-B07: Baking powder, O-B07: Egg, O-B07: Plain flour, O-B07: Water, O-B09: Beef mince, O-B09: Black pepper, O-B09: Carrot trimmed, O-B09: Curry powder, O-B09: Garlic peeled, O-B09: Ginger peeled, O-B09: Onion trimmed, O-B09: Plain flour, O-B09: Potato peeled, O-B09: Thyme, O-B09: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 26.10 FCFA for 22 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.61 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. O-P08 Sausage rolls

Status: Harmonized source formulation — production trial required

Source: S163; lines 1387-1418.

Quality target: Crisp pastry with a fully cooked moist meat centre and clean slice.

Pilot: 24 saleable units. Planning production batch: 120 units. Portion: 24 x 65 g pastry + 40 g raw filling; about 88–96 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B07 Shortcrust pie pastry	1,740	8,700
O-B10 Sausage roll filling	960	4,800
Egg	45	225

1. Make O-B07 and keep O-B10 cold. Portion 24 rolls with 65 g pastry and 40 g raw filling each. Pastry surplus is 180 g; O-B10 batch leaves 20 g.

2. Form cylinders, enclose and seal pastry, apply 45 g allocated egg wash and vent the tops.

3. Trial bake at 190–200°C for 23–30 minutes. Probe meat to C01–C05 ground-meat limit, or poultry limit if sausage contains poultry.

4. Hold and transport under H. Record any grease leakage before adjusting meat fat or crumb content.

Holding and packaging: H — Serve immediately or hold hot under C01–C05. With the specified raw sausage filling, a fully baked roll may instead be rapidly cooled and reheated once using chapter 6. House hot-display quality target: at most 2 hours. Record the actual filling heat history.

Troubleshooting: Raw centre: rolls too thick or oven too hot; greasy pastry: high-fat filling; splitting: poor vent/seal.

Substitution: Supplier-seasoned mince can replace sausage meat only after checking salt, species and allergen details.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B07 Shortcrust pie pastry	63.39
O-B10 Sausage roll filling	34.97
Egg	1.64

Total-formula basis: 2,745.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B07 Shortcrust pie pastry	1,740.00	308.19	536.25
O-B10 Sausage roll filling	960.00	0.99	0.95

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Egg	45.00	UNPRICED	UNPRICED

Known ingredient subtotal: **537.20 FCFA per pilot**. Unpriced or unresolved inputs: Egg, O-B07: Baking powder, O-B07: Egg, O-B07: Plain flour, O-B07: Water, O-B10: Black pepper, O-B10: Breadcrumbs, O-B10: Egg, O-B10: Garlic peeled, O-B10: Onion trimmed, O-B10: Paprika, O-B10: Sausage meat. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 22.38 FCFA for 24 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.24 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

O-P09 Creamy chicken pies

Status: Harmonized source formulation — production trial required

Source: S163; lines 1419-1450.

Quality target: Golden short pastry, moist chicken pieces and a thick sauce that does not run.

Pilot: 21 saleable units. Planning production batch: 105 units. Portion: 21 x 80 g pastry + 60 g filling; about 125–133 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B07 Shortcrust pie pastry	1,740	8,700
O-B11 Creamy chicken filling	1,260	6,300
Egg	45	225

1. Make O-B07 and O-B11. Use twenty-one 80 g pastry portions and 60 g chilled filling each; dough spare 60 g, full O-B11 spare 40 g.

2. Seal, vent and apply allocated egg wash. Keep waiting trays refrigerated.

3. Trial bake at 190–200°C for 23–30 minutes; verify filling reaches C01–C05 reheating temperature.

4. Use H holding; limit hot display batches because pastry quality declines before safety-controlled holding necessarily ends.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Soggy pastry: loose sauce; dry chicken: prolonged hot holding; split pies: overfilled.

Substitution: Use cooked thigh from a separately costed plain preparation; do not assume raw and cooked chicken weights are interchangeable.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B07 Shortcrust pie pastry	57.14
O-B11 Creamy chicken filling	41.38
Egg	1.48

Total-formula basis: 3,045.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B07 Shortcrust pie pastry	1,740.00	308.19	536.25
O-B11 Creamy chicken filling	1,260.00	32.56	41.03

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Egg	45.00	UNPRICED	UNPRICED

Known ingredient subtotal: **577.28 FCFA per pilot**. Unpriced or unresolved inputs: Egg, O-B07: Baking powder, O-B07: Egg, O-B07: Plain flour, O-B07: Water, O-B11: Black pepper, O-B11: Carrot trimmed, O-B11: Chicken boneless, O-B11: Garlic peeled, O-B11: Onion trimmed, O-B11: Pepper trimmed, O-B11: Plain flour, O-B11: Potato peeled, O-B11: Thyme, O-B11: UHT milk, O-B11: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 27.49 FCFA for 21 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.75 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. O-P10 Whole egg dough rolls

Status: Harmonized source formulation — production trial required

Source: S163; lines 1451-1482.

Quality target: A whole fully cooked egg centred inside evenly fried dough, with no wet seam.

Pilot: 16 saleable units. Planning production batch: 80 units. Portion: 16 x 100 g dough + 50 g peeled cooked egg; about 140–148 g fried. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B12 Egg roll dough	1,650	8,250
O-B13 Hard boiled peeled eggs	800	4,000
Oil	180	900

1. Prepare O-B12 and O-B13. Use sixteen 100 g dough pieces and sixteen cooked eggs averaging 50 g each; charge 50 g dough surplus to QC.

2. Wrap eggs evenly, close seams tightly and proof 20–35 minutes.

3. Trial fry at 165–170°C for 7–10 minutes, turning. Split a sample and check both dough doneness and reheated centre under C01–C05.

4. Use H holding. Full O-B13 output is 970 g: 170 g remains for separately recorded use or the next scaled batch, within the same safe production plan.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Burnt outside/raw inner dough: too high oil temperature; bursting: trapped air; uneven portions: egg sizes not checked.

Substitution: Smaller eggs require a separately priced smaller product, not silent substitution.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B12 Egg roll dough	62.74
O-B13 Hard boiled peeled eggs	30.42
Oil	6.84

Total-formula basis: 2,630.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B12 Egg roll dough	1,650.00	101.48	167.45

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B13 Hard boiled peeled eggs	800.00	0.00	0.00
Oil	180.00	1,413.04	254.35

Known ingredient subtotal: **421.80 FCFA per pilot**. Unpriced or unresolved inputs: O-B12: Nutmeg, O-B12: Plain flour, O-B12: Water, O-B12: Whole milk powder, O-B13: Egg. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 26.36 FCFA for 16 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.64 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P11 Banana condensed milk cake slices

Status: Harmonized source formulation — production trial required

Source: S163; lines 1483-1512.

Quality target: Moist but set crumb, clear banana aroma, clean slices and no compressed wet line.

Pilot: 24 saleable units. Planning production batch: 120 units. Portion: 3 x 1,000 g batter loaves; 24 slices about 105–113 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B14 Banana condensed milk cake batter	3,010	15,050

1. Prepare O-B14 and fill three suitable loaf tins with 1,000 g batter each; 10 g is bowl/QC allocation. Choose tins with enough expansion space.

2. Trial bake at 170–180°C for 45–60 minutes; use a clean skewer and spring-back rather than time alone.

3. Cool fully, weigh each loaf, and cut each into eight equal slices; expected bake loss 10–16%.

4. Package slices only after cooling. Use moist-cake holding class M; do not assert a multi-day ambient shelf life.

Holding and packaging: M — Moist banana cake: sell on production day; protect during short display and refrigerate reserve stock at or below 4°C. Ambient multi-day shelf life requires a competent water-activity/pH assessment and validation.

Troubleshooting: Sunken centre: underbake/excess raising; gummy crumb: wet bananas; dry slice: excess bake or thin portions.

Substitution: Swap some banana for pumpkin only through a new moisture trial; optional nuts require new allergen control and cost.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B14 Banana condensed milk cake batter	100.00

Total-formula basis: 3,010.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B14 Banana condensed milk cake batter	3,010.00	188.13	566.27

Known ingredient subtotal: **566.27 FCFA per pilot**. Unpriced or unresolved inputs: O-B14: Baking powder, O-B14: Baking soda, O-B14: Banana peeled, O-B14: Cinnamon, O-B14: Condensed milk, O-B14: Egg, O-B14: Plain flour, O-B14: Vanilla. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 23.59 FCFA for 24 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.36 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P12 Personal chicken pizza

Status: Harmonized source formulation — production trial required

Source: S163; lines 1513-1547.

Quality target: Crisp underside, cooked centre, melted cheese and a a measured 50 g cooked-chicken input before baking portion.

Pilot: 11 saleable units. Planning production batch: 55 units. Portion: 11 x 150 g dough + 160 g toppings; about 275–290 g baked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B15 Pizza dough	1,690	8,450
O-B16 Pizza tomato sauce	440	2,200
O-B18 Cooked chicken shawarma meat	550	2,750
Mozzarella	550	2,750
Onion trimmed	110	550
Pepper trimmed	110	550

1. Make O-B15. Use eleven 150 g bases; 40 g dough spare is charged to QC.

2. Per base add 40 g O-B16, 50 g cooked O-B18, 50 g mozzarella, 10 g onion and 10 g pepper. Keep prepared toppings refrigerated.

3. Trial bake at 230–250°C for 7–11 minutes only if the diesel oven is rated for this temperature. Check base and reheated chicken under C01–C05; hotter baking needs a separate oven schedule.

4. Serve immediately. If the rotary oven cannot deliver a suitable base at its approved setting, postpone pizza or use a tested par-baked base workflow with controlled cooling.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Wet centre: excess sauce or low oven recovery; burnt cheese: long bake; high cost: uncontrolled cheese handfuls.

Substitution: Use less expensive melting cheese only after taste/melt testing; never replace measured chicken with extra fries.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B15 Pizza dough	48.99
O-B16 Pizza tomato sauce	12.75
O-B18 Cooked chicken shawarma meat	15.94
Mozzarella	15.94
Onion trimmed	3.19
Pepper trimmed	3.19

Total-formula basis: 3,450.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B15 Pizza dough	1,690.00	299.73	506.54
O-B16 Pizza tomato sauce	440.00	72.43	31.87
O-B18 Cooked chicken shawarma meat	550.00	60.67	33.37
Mozzarella	550.00	UNPRICED	UNPRICED
Onion trimmed	110.00	UNPRICED	UNPRICED
Pepper trimmed	110.00	UNPRICED	UNPRICED

Known ingredient subtotal: **571.78 FCFA per pilot**. Unpriced or unresolved inputs: Mozzarella, O-B15: Water, O-B16: Black pepper, O-B16: Garlic peeled, O-B16: Onion trimmed, O-B16: Oregano, O-B16: Tomato trimmed, O-B18: Black pepper, O-B18: Chicken boneless, O-B18: Chili trimmed, O-B18: Cinnamon, O-B18: Coriander, O-B18: Cumin, O-B18: Garlic peeled, O-B18: Lemon juice, O-B18: Paprika, O-B18: Vinegar 5%, O-B18: Yogurt plain, Onion trimmed, Pepper trimmed. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 51.98 FCFA for 11 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 5.20 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. O-P13 Complete chicken shawarma

Status: Harmonized source formulation — production trial required

Source: S163; lines 1548-1583.

Quality target: Flexible wrap, hot juicy meat, crisp fries and balanced sauce with a tight clean roll.

Pilot: 16 saleable units. Planning production batch: 80 units. Portion: 1 wrap + 110 g cooked chicken + 145 g additions; about 345 g. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B17 Shawarma flatbread	1,500	7,500
O-B18 Cooked chicken shawarma meat	1,760	8,800
O-B24 Crisp fries	800	4,000
O-B22 Shawarma slaw	720	3,600
O-B23 Refrigerator cucumber pickles	240	1,200
O-B20 Garlic mayonnaise sauce	480	2,400
O-B21 Cooked hot sauce	80	400

1. Prepare the exact components in chapter 4; this card costs sixteen full standard wraps. O-B17 delivers 16 x 90 g bread with 60 g allowance.

2. For each wrap weigh 110 g cooked O-B18, 50 g O-B24 fries, 45 g O-B22 slaw, 15 g O-B23 pickles, 30 g O-B20 garlic sauce and optional 5 g O-B21 hot sauce; hot sauce cost is included.

3. Assemble using separate hot and ready-to-eat utensils. Fold sides, roll firmly and toast about 30–60 seconds per side on the clean hot plate without crushing.

4. Wrap in food-contact paper and hand over immediately. Use fresh safe service stock; a filled wrap is not a long-hold product.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Wet wrap: undrained slaw or excess sauce; dry bread: overbaking; chewy meat: wrong cut or excessive holding.

Substitution: Use thigh as default; breast needs separate moisture/yield tests. A garlic-only mild option omits hot sauce without changing meat.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B17 Shawarma flatbread	26.88
O-B18 Cooked chicken shawarma meat	31.54
O-B24 Crisp fries	14.34
O-B22 Shawarma slaw	12.90
O-B23 Refrigerator cucumber pickles	4.30
O-B20 Garlic mayonnaise sauce	8.60
O-B21 Cooked hot sauce	1.43

Total-formula basis: 5,580.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. O-P14 Complete beef shawarma

Status: Harmonized source formulation — production trial required

Source: S163; lines 1584-1619.

Quality target: Tender sliced beef with a balanced sesame sauce, no gristle and an intact wrap.

Pilot: 16 saleable units. Planning production batch: 80 units. Portion: 1 wrap + 110 g cooked beef + 145 g additions; about 345 g. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B17 Shawarma flatbread	1,500	7,500
O-B19 Cooked beef shawarma meat	1,760	8,800
O-B24 Crisp fries	800	4,000
O-B22 Shawarma slaw	720	3,600
O-B23 Refrigerator cucumber pickles	240	1,200
O-B35 Beef shawarma sesame sauce	480	2,400
O-B21 Cooked hot sauce	80	400

1. Use the same sixteen-wrap bread allocation as O-P13, substituting cooked O-B19 beef and O-B35 sesame sauce.

2. Assemble each with 110 g cooked beef, 50 g fries, 45 g slaw, 15 g drained pickles, 30 g sesame sauce and optional 5 g hot sauce.

3. Toast and wrap as O-P13. Check the raw-purchase quantity using 70% beef yield before purchasing.

4. Serve immediately and disclose sesame. Keep sauce utensils separate from the garlic-only option.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Tough beef: wrong cut or slicing direction; bitter sauce: poor tahini; wet wrap: excess liquid.

Substitution: O-B20 can replace O-B35 at 30 g per wrap for a sesame-free recipe only when cross-contact can also be controlled.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B17 Shawarma flatbread	26.88
O-B19 Cooked beef shawarma meat	31.54
O-B24 Crisp fries	14.34
O-B22 Shawarma slaw	12.90
O-B23 Refrigerator cucumber pickles	4.30
O-B35 Beef shawarma sesame sauce	8.60
O-B21 Cooked hot sauce	1.43

Total-formula basis: 5,580.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

O-P15 Crispy chicken burger

Status: Harmonized source formulation — production trial required

Source: S163; lines 1620-1654.

Quality target: Toasted soft bun, crisp fully cooked chicken and fresh measured garnish.

Pilot: 10 saleable units. Planning production batch: 50 units. Portion: 87 g bun + 110 g cooked coated chicken + 75 g garnish; about 272 g. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B25 Burger buns	870	4,350
O-B26 Cooked crispy chicken pieces	1,100	5,500
O-B28 Burger sauce	250	1,250
Lettuce trimmed	150	750
Tomato trimmed	250	1,250
O-B23 Refrigerator cucumber pickles	100	500

1. Make or allocate O-B25 buns; a full batch supplies eighteen buns, of which ten are used here.

2. Use ten 110 g cooked coated O-B26 portions. Toast split buns on a clean hot plate.

3. Per burger add 25 g O-B28 sauce, 15 g lettuce, 25 g tomato and 10 g drained pickles. Keep garnish cold until assembly.

4. Serve immediately in a vented box. Optional cheese is 20 g and costs extra; fries are not included.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Soggy crust: covered hot chicken or early assembly; raw middle: chicken too thick; slippery burger: watery tomato.

Substitution: A grilled O-B18 chicken burger is a separate 110 g cooked-meat option with recalculated cost.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B25 Burger buns	31.99
O-B26 Cooked crispy chicken pieces	40.44
O-B28 Burger sauce	9.19
Lettuce trimmed	5.51
Tomato trimmed	9.19
O-B23 Refrigerator cucumber pickles	3.68

Total-formula basis: 2,720.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B25 Burger buns	870.00	359.77	313.00
O-B26 Cooked crispy chicken pieces	1,100.00	150.15	165.17
O-B28 Burger sauce	250.00	4.00	1.00
Lettuce trimmed	150.00	UNPRICED	UNPRICED
Tomato trimmed	250.00	UNPRICED	UNPRICED
O-B23 Refrigerator cucumber pickles	100.00	65.06	6.51

Known ingredient subtotal: **485.67 FCFA per pilot**. Unpriced or unresolved inputs: Lettuce trimmed, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B25: Egg, O-B25: Water, O-B25: Whole milk powder, O-B26: Black pepper, O-B26: Chicken boneless, O-B26: Corn starch, O-B26: Garlic peeled, O-B26: Ginger peeled, O-B26: Paprika, O-B26: Plain flour, O-B26: Water, O-B26: Yogurt plain, O-B28: Ketchup, O-B28: Mayonnaise pasteurized, O-B28: Mustard, O-B28: O-B23: Cucumber trimmed, O-B28: O-B23: Vinegar 5%, O-B28: O-B23: Water, O-B28: Paprika, Tomato trimmed. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 48.57 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 4.86 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P16 Beef cheeseburger

Status: Harmonized source formulation — production trial required

Source: S163; lines 1655-1691.

Quality target: Fully cooked juicy patty, melted cheese, toasted bun and a balanced bite.

Pilot: 10 saleable units. Planning production batch: 50 units. Portion: 87 g bun + 75 g cooked patty + 105 g cheese/garnish; about 267 g. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B25 Burger buns	870	4,350
O-B27 Cooked beef burger patties	750	3,750
Cheese slices	200	1,000
O-B28 Burger sauce	250	1,250
Lettuce trimmed	150	750
Tomato trimmed	250	1,250
Onion trimmed	100	500
O-B23 Refrigerator cucumber pickles	100	500

1. Prepare ten O-B27 patties from the full base batch, verifying C01–C05 ground-meat temperature.

2. Toast ten O-B25 buns. Melt 20 g cheese on each cooked patty briefly.

3. Add 25 g sauce, 15 g lettuce, 25 g tomato, 10 g onion and 10 g pickles per burger.

4. Serve immediately. Advertise raw patty mass only if clearly labelled; the cooked target is 75 g, not 100 g.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Dry patty: lean mince or overholding; domed patty: poor shaping; cold centre: heat too high/short cook.

Substitution: Do not add breadcrumbs to conceal a beef reduction; a lower-cost patty needs a disclosed new formula.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B25 Burger buns	32.58
O-B27 Cooked beef burger patties	28.09
Cheese slices	7.49
O-B28 Burger sauce	9.36
Lettuce trimmed	5.62
Tomato trimmed	9.36
Onion trimmed	3.75
O-B23 Refrigerator cucumber pickles	3.75

Total-formula basis: 2,670.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B25 Burger buns	870.00	359.77	313.00
O-B27 Cooked beef burger patties	750.00	21.95	16.46
Cheese slices	200.00	UNPRICED	UNPRICED
O-B28 Burger sauce	250.00	4.00	1.00
Lettuce trimmed	150.00	UNPRICED	UNPRICED
Tomato trimmed	250.00	UNPRICED	UNPRICED
Onion trimmed	100.00	UNPRICED	UNPRICED
O-B23 Refrigerator cucumber pickles	100.00	65.06	6.51

Known ingredient subtotal: **336.97 FCFA per pilot**. Unpriced or unresolved inputs: Cheese slices, Lettuce trimmed, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B25: Egg, O-B25: Water, O-B25: Whole milk powder, O-B27: Beef mince, O-B27: Black pepper, O-B27: Paprika, O-B28: Ketchup, O-B28: Mayonnaise pasteurized, O-B28: Mustard, O-B28: O-B23: Cucumber trimmed, O-B28: O-B23: Vinegar 5%, O-B28: O-B23: Water, O-B28: Paprika, Onion trimmed, Tomato trimmed. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 33.70 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.37 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P17 Crispy chicken and fries box

Status: Harmonized source formulation — production trial required

Source: S163; lines 1692-1723.

Quality target: Crisp chicken pieces, hot fries, sauce in a separate cup and no trapped steam.

Pilot: 5 saleable units. Planning production batch: 25 units. Portion: 220 g cooked coated chicken + 150 g fries + 30 g sauce. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B26 Cooked crispy chicken pieces	1,100	5,500
O-B24 Crisp fries	750	3,750
O-B28 Burger sauce	150	750

1. Prepare O-B26 as smaller even strips, applying the same full cooking checks. Allocate 220 g cooked coated chicken per box.

2. Finish 150 g O-B24 fries per box near handover; salt consistently.

3. Place 30 g O-B28 sauce in a separate cup. Use a vented food box.

4. Serve promptly. Do not describe this boneless-strip portion as a specified number of bone-in pieces.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Soft crust: steaming sealed box; uneven cook: mixed piece sizes; low contribution: unweighed chicken.

Substitution: Bone-in chicken needs a separate raw-weight, yield and cook validation; this cost is for boneless portions.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B26 Cooked crispy chicken pieces	55.00
O-B24 Crisp fries	37.50
O-B28 Burger sauce	7.50

Total-formula basis: 2,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B26 Cooked crispy chicken pieces	1,100.00	150.15	165.17
O-B24 Crisp fries	750.00	263.26	197.45
O-B28 Burger sauce	150.00	4.00	0.60

Known ingredient subtotal: **363.22 FCFA per pilot**. Unpriced or unresolved inputs: O-B24: Potato peeled, O-B26: Black pepper, O-B26: Chicken boneless, O-B26: Corn starch, O-B26: Garlic peeled, O-B26: Ginger peeled, O-B26: Paprika, O-B26: Plain flour, O-B26: Water, O-B26: Yogurt plain, O-B28: Ketchup, O-B28: Mayonnaise pasteurized, O-B28: Mustard, O-B28: O-B23: Cucumber trimmed, O-B28: O-B23: Vinegar 5%, O-B28: O-B23: Water, O-B28: Paprika. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 72.64 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 7.26 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P18 Chicken vegetable samosas

Status: Harmonized source formulation — production trial required

Source: S163; lines 1724-1756.

Quality target: Thin crisp triangular shell, generous dry filling and fully sealed corners.

Pilot: 50 saleable units. Planning production batch: 250 units. Portion: 50 x 30 g wrapper + 40 g filling + 2 g paste; about 65–72 g cooked. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B29 Samosa wrapper dough	1,510	7,550
O-B31 Chicken vegetable samosa filling	2,000	10,000
O-B30 Samosa sealing paste	100	500
Oil	200	1,000

1. Make O-B29 and two O-B31 batches. Weigh fifty 30 g wrappers, 40 g chilled filling and 2 g sealing paste each; wrapper spare 10 g.

2. Fold into cones, fill without air pockets and seal firmly. O-B30 must be scaled to supply 100 g usable paste, slightly above one base batch.

3. Fry at a trial 170–175°C for 4–6 minutes until crisp and filling meets C01–C05 reheating control.

4. Drain and use H holding. For catering, agree a timed handover and holding method rather than leaving trays at ambient temperature.

Holding and packaging: H — The final bake/fry reheats the previously cooked chilled filling or topping. Serve promptly or hold hot under C01–C05, with a house quality target of at most 2 hours. Do not cool finished leftovers for another reheat. Follow the product-specific transport and finishing route in chapter 6.

Troubleshooting: Blisters/leaks: poor seal or wet filling; tough wrapper: too thick; greasy shell: low oil temperature.

Substitution: Vegetable version can replace chicken with cooked lentils only as a separately costed and labelled new filling.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B29 Samosa wrapper dough	39.63
O-B31 Chicken vegetable samosa filling	52.49
O-B30 Samosa sealing paste	2.62
Oil	5.25

Total-formula basis: 3,810.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B29 Samosa wrapper dough	1,510.00	58.47	88.28
O-B31 Chicken vegetable samosa filling	2,000.00	44.72	89.45
O-B30 Samosa sealing paste	100.00	0.00	0.00
Oil	200.00	1,413.04	282.61

Known ingredient subtotal: **460.34 FCFA per pilot**. Unpriced or unresolved inputs: O-B29: Plain flour, O-B29: Water, O-B30: Plain flour, O-B30: Water, O-B31: Carrot trimmed, O-B31: Chicken boneless, O-B31: Cumin, O-B31: Curry powder, O-B31: Garlic peeled, O-B31: Ginger peeled, O-B31: Onion trimmed, O-B31: Potato peeled, O-B31: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 9.21 FCFA for 50 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.92 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P19 Loaded chicken shawarma fries

Status: Harmonized source formulation — production trial required

Source: S163; lines 1757-1790.

Quality target: Hot crisp fries, evenly distributed chicken and restrained sauces.

Pilot: 5 saleable units. Planning production batch: 25 units. Portion: 180 g fries + 80 g chicken + 25 g garlic sauce + 5 g hot sauce + 15 g pickle. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B24 Crisp fries	900	4,500
O-B18 Cooked chicken shawarma meat	400	2,000
O-B20 Garlic mayonnaise sauce	125	625
O-B21 Cooked hot sauce	25	125
O-B23 Refrigerator cucumber pickles	75	375

1. Finish five portions of 180 g fries close to service.

2. Add 80 g freshly cooked or safely held O-B18 chicken to each, then 25 g O-B20, 5 g O-B21 and 15 g drained O-B23.

3. Use a wide shallow tray; sauce immediately before handover.

4. Never use this product to dispose of meat outside its safe time/temperature controls.

Holding and packaging: I — Assemble to order: keep hot and cold components separately controlled under C01–C05 until assembly. Hand over promptly and recommend immediate consumption; do not build an ambient ready-wrapped stock.

Troubleshooting: Soggy base: over-saucing or deep closed box; uneven value: unweighed chicken; lukewarm fries: early assembly.

Substitution: Offer mild with sauce on the side; removing hot sauce alone does not materially reduce cost.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B24 Crisp fries	59.02
O-B18 Cooked chicken shawarma meat	26.23
O-B20 Garlic mayonnaise sauce	8.20
O-B21 Cooked hot sauce	1.64
O-B23 Refrigerator cucumber pickles	4.92

Total-formula basis: 1,525.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B24 Crisp fries	900.00	263.26	236.94
O-B18 Cooked chicken shawarma meat	400.00	60.67	24.27
O-B20 Garlic mayonnaise sauce	125.00	1.00	0.12
O-B21 Cooked hot sauce	25.00	81.62	2.04
O-B23 Refrigerator cucumber pickles	75.00	65.06	4.88

Known ingredient subtotal: **268.25 FCFA per pilot**. Unpriced or unresolved inputs: O-B18: Black pepper, O-B18: Chicken boneless, O-B18: Chili trimmed, O-B18: Cinnamon, O-B18: Coriander, O-B18: Cumin, O-B18: Garlic peeled, O-B18: Lemon juice, O-B18: Paprika, O-B18: Vinegar 5%, O-B18: Yogurt plain, O-B20: Black pepper, O-B20: Garlic peeled, O-B20: Lemon juice, O-B20: Mayonnaise pasteurized, O-B20: Water, O-B21: Chili trimmed, O-B21: Garlic peeled, O-B21: Onion trimmed, O-B21: Tomato trimmed, O-B21: Vinegar 5%, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B24: Potato peeled. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 53.65 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 5.36 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-P20 Condensed milk soaked cake portions

Status: Harmonized source formulation — production trial required

Source: S163; lines 1791-1821.

Quality target: Moist evenly soaked sponge that holds its shape, with no large pool of liquid.

Pilot: 12 saleable units. Planning production batch: 60 units. Portion: 950 g baked sponge + 800 g soak; 12 portions about 140 g after trim. Scale all components x5; validate capacity and losses before adoption.

Prepared component or ingredient	Pilot g	Production g
O-B32 baked milk cake sponge	950	4,750
O-B33 Three milk soak	800	4,000

1. Bake a full O-B32 sponge and cool. Make or allocate 800 g O-B33; a full soak base leaves 190 g.

2. Prick sponge evenly, apply the weighed cold soak gradually, cover and refrigerate immediately.

3. Chill 4 hours as a quality trial; trim and divide into twelve portions. Gross cake mass 1,750 g less 70 g planned trim leaves 1,680 g, or 140 g each.

4. Sell from a refrigerator under holding class C. No whipped topping is included; add one only with a full formula, cost and cold-chain plan.

Holding and packaging: C — Chilled dairy cake: display and transport at or below 4°C. House pilot policy is prepare for same-day sale and discard unsold portions at close. This is a conservative operating policy, not a validated shelf life.

Troubleshooting: Wet puddles: too much soak or weak sponge; dry centre: uneven perforation; collapse: underbaked sponge.

Substitution: Use UHT milk and cream as specified; evaporated milk substitutions need solids/sweetness recalculation.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B32 baked milk cake sponge	54.29
O-B33 Three milk soak	45.71

Total-formula basis: 1,750.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

O-A01 Roast chicken burger — ten-unit pilot

Status: Harmonized source formulation — production trial required

Source: S163; lines 1822-1837.

Use O-B25 buns and O-B28 sauce exactly as formulated earlier. This is an oven-roasted alternative to O-P15's crispy chicken.

Component	Final amount per burger g	Ten-unit pilot g
O-B25 baked bun	87	870
O-B18 chicken, after final reheat	110	1,100
O-B28 burger sauce	25	250
Lettuce	15	150
Tomato	25	250
O-B23 drained pickles	10	100
Finished assembly	272	2,720

At 95% reheating retention, prepare 1,157.9 g chilled O-B18 chicken: multiply every ingredient in the O-B18 750 g base by 1.54386 (raw boneless chicken 1,543.9 g). Weigh ten chilled portions about 115.8 g, then confirm 110 g after reheating. Reheat chicken under C01–C05, toast bun, spread sauce, add lettuce/tomato/pickles and assemble promptly. Choose a bun diameter that holds the chicken without excessive stacking. Keep sauce and vegetables refrigerated until assembly. For 50 burgers multiply every table quantity and base scaling factor by five after the pilot passes. Allergens: wheat/gluten, milk, egg and mustard in the specified bases; check purchased sauce labels. Current costing correction: the cost table below charges the chilled protein quantity BEFORE final heating, dividing the final target by 0.95. This allowance is applied once. The original assembly table states final component targets.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B25 baked bun	31.32
O-B18 chicken before final heating (95% retention trial)	41.68
O-B28 burger sauce	9.00
Lettuce	5.40
Tomato	9.00
O-B23 drained pickles	3.60

Total-formula basis: 2,777.89 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 15–30 minutes active labour for ten assemblies, assuming components are ready; allow 20–45 minutes elapsed including finishing. Component preparation and cooling are scheduled separately.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B25 baked bun	870.00	359.77	313.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B18 chicken before final heating (95% retention trial)	1,157.89	60.67	70.25
O-B28 burger sauce	250.00	4.00	1.00
Lettuce	150.00	UNPRICED	UNPRICED
Tomato	250.00	UNPRICED	UNPRICED
O-B23 drained pickles	100.00	65.06	6.51

Known ingredient subtotal: **390.75 FCFA per pilot**. Unpriced or unresolved inputs: Lettuce, O-B18: Black pepper, O-B18: Chicken boneless, O-B18: Chili trimmed, O-B18: Cinnamon, O-B18: Coriander, O-B18: Cumin, O-B18: Garlic peeled, O-B18: Lemon juice, O-B18: Paprika, O-B18: Vinegar 5%, O-B18: Yogurt plain, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B25: Egg, O-B25: Water, O-B25: Whole milk powder, O-B28: Ketchup, O-B28: Mayonnaise pasteurized, O-B28: Mustard, O-B28: O-B23: Cucumber trimmed, O-B28: O-B23: Vinegar 5%, O-B28: O-B23: Water, O-B28: Paprika, Tomato. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 39.08 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.91 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-A02 Lemon-garlic fish burger — ten-unit pilot

Status: Harmonized source formulation — production trial required

Source: S163; lines 1838-1851.

Component	Final amount per burger g	Ten-unit pilot g
O-B25 baked bun	87	870
O-B36 fish, after final reheat	120	1,200
O-B28 burger sauce	25	250
Lettuce	15	150
Tomato	20	200
O-B23 drained pickles	10	100
Finished assembly	277	2,770

Multiply every O-B36 ingredient by 1,200/760 = 1.57895 (raw boneless fish 1,578.9 g). Chilled fish needed is 1,263.2 g, or about 126.3 g per portion, to target 120 g after reheating. Reheat gently but completely under C01–C05; use a broad clean spatula to keep pieces intact. Toast bun, spread sauce, add fish and cold garnish, and hand over promptly. For cooking to order, use measured first-cook yield instead of adding an unnecessary reheat allowance. For 50 burgers multiply all pilot quantities by five after validation. Allergens: fish, wheat/gluten, milk, egg and mustard; segregate fish from the beef/chicken service tools. Current costing correction: the cost table below charges the chilled protein quantity BEFORE final heating, dividing the final target by 0.95. This allowance is applied once. The original assembly table states final component targets.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B25 baked bun	30.71
O-B36 fish before final heating (95% retention trial)	44.58
O-B28 burger sauce	8.82
Lettuce	5.29
Tomato	7.06
O-B23 drained pickles	3.53

Total-formula basis: 2,833.16 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 15–30 minutes active labour for ten assemblies, assuming components are ready; allow 20–45 minutes elapsed including finishing. Component preparation and cooling are scheduled separately.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B25 baked bun	870.00	359.77	313.00
O-B36 fish before final heating (95% retention trial)	1,263.16	46.59	58.85
O-B28 burger sauce	250.00	4.00	1.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Lettuce	150.00	UNPRICED	UNPRICED
Tomato	200.00	UNPRICED	UNPRICED
O-B23 drained pickles	100.00	65.06	6.51

Known ingredient subtotal: **379.35 FCFA per pilot**. Unpriced or unresolved inputs: Lettuce, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B25: Egg, O-B25: Water, O-B25: Whole milk powder, O-B28: Ketchup, O-B28: Mayonnaise pasteurized, O-B28: Mustard, O-B28: O-B23: Cucumber trimmed, O-B28: O-B23: Vinegar 5%, O-B28: O-B23: Water, O-B28: Paprika, O-B36: Black pepper, O-B36: Boneless trimmed white fish, O-B36: Garlic, finely crushed, O-B36: Lemon juice, O-B36: Paprika, Tomato. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 37.94 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.79 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Fish Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. O-A03 Lemon fish wrap — ten-unit pilot

Status: Harmonized source formulation — production trial required

Source: S163; lines 1852-1866.

Component	Final amount per wrap g	Ten-unit pilot g
O-B17 cooked flatbread	90	900
O-B36 fish, after final reheat	100	1,000
O-B22 cabbage carrot slaw	45	450
O-B23 drained pickles	15	150
O-B20 garlic sauce	25	250
O-B24 freshly cooked fries	35	350
O-B21 hot sauce, optional but costed	5	50
Finished assembly	315	3,150

Multiply all O-B36 ingredients by 1,000/760 = 1.31579 (raw fillet 1,315.8 g); target 1,052.6 g chilled fish before reheating. Scale every other base by the pilot quantity divided by its listed usable yield. Warm the bread, reheat fish under C01–C05, cook fries fresh, then add weighed slaw, pickles and sauces. Fold gently so fish does not crush the bread; a short final toast is for the bread after the protein has met C01–C05. Serve immediately. The ten portions consume exactly the listed prepared component amounts; any whole-base leftovers require planned same-day use or a waste charge. Scale to 50 wraps by multiplying every pilot quantity by five. Allergens: fish, wheat/gluten and egg/mustard as present in sauces; check milk in purchased ingredients. Current costing correction: the cost table below charges the chilled protein quantity BEFORE final heating, dividing the final target by 0.95. This allowance is applied once. The original assembly table states final component targets.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B17 cooked flatbread	28.10
O-B36 fish before final heating (95% retention trial)	32.87
O-B22 cabbage carrot slaw	14.05
O-B23 drained pickles	4.68
O-B20 garlic sauce	7.81
O-B24 freshly cooked fries	10.93
O-B21 hot sauce, optional but costed	1.56

Total-formula basis: 3,202.63 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 15–30 minutes active labour for ten assemblies, assuming components are ready; allow 20–45 minutes elapsed including finishing. Component preparation and cooling are scheduled separately.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B17 cooked flatbread	900.00	325.88	293.29
O-B36 fish before final heating (95% retention trial)	1,052.63	46.59	49.04
O-B22 cabbage carrot slaw	450.00	10.84	4.88
O-B23 drained pickles	150.00	65.06	9.76
O-B20 garlic sauce	250.00	1.00	0.25
O-B24 freshly cooked fries	350.00	263.26	92.14
O-B21 hot sauce, optional but costed	50.00	81.62	4.08

Known ingredient subtotal: **453.45 FCFA per pilot**. Unpriced or unresolved inputs: O-B17: Water, O-B20: Black pepper, O-B20: Garlic peeled, O-B20: Lemon juice, O-B20: Mayonnaise pasteurized, O-B20: Water, O-B21: Chili trimmed, O-B21: Garlic peeled, O-B21: Onion trimmed, O-B21: Tomato trimmed, O-B21: Vinegar 5%, O-B22: Cabbage trimmed, O-B22: Carrot trimmed, O-B22: Onion trimmed, O-B22: Vinegar 5%, O-B23: Cucumber trimmed, O-B23: Vinegar 5%, O-B23: Water, O-B24: Potato peeled, O-B36: Black pepper, O-B36: Boneless trimmed white fish, O-B36: Garlic, finely crushed, O-B36: Lemon juice, O-B36: Paprika. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 45.34 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 4.53 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Fish Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-A04 Beef mini pizza — ten-unit pilot

Status: Harmonized source formulation — production trial required

Source: S163; lines 1867-1879.

Component	Amount per pizza g	Ten-unit pilot g
O-B15 pizza dough	150	1,500
O-B16 pizza sauce	40	400
O-B19 beef, final target after pizza bake	50	500
Mozzarella	50	500
Onion	10	100
Sweet pepper	10	100

Use 526.3 g chilled O-B19 beef at the illustrative 95% final-bake retention: scale every O-B19 ingredient by 526.3/700 = 0.75188 (raw beef 751.9 g). Do not separately reheat the beef and then store it again. Prepare ten 150 g dough rounds using O-B15, add 40 g sauce, 52.6 g cold cooked beef, 50 g cheese and 10 g each onion/pepper. Trial bake using O-P12's oven method and check that the meat topping reaches C01–C05 during that same bake. The bake is the beef's one reheating step. Serve immediately or hold hot under C01–C05; do not cool unsold pizzas for another reheat. Target approximately 275–290 g finished pizza, verified by weighing; moisture losses in dough and vegetables are separate from the meat allowance. Scale to 50 pizzas by multiplying all ingredients by five. Allergens: wheat/gluten and milk, plus anything declared in purchased sauces. Current costing correction: the cost table below charges the chilled protein quantity BEFORE final heating, dividing the final target by 0.95. This allowance is applied once. The original assembly table states final component targets.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-B15 pizza dough	47.98
O-B16 pizza sauce	12.79
O-B19 beef before final heating (95% retention trial)	16.84
Mozzarella	15.99
Onion	3.20
Sweet pepper	3.20

Total-formula basis: 3,126.32 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 15–30 minutes active labour for ten assemblies, assuming components are ready; allow 20–45 minutes elapsed including finishing. Component preparation and cooling are scheduled separately.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B15 pizza dough	1,500.00	299.73	449.60
O-B16 pizza sauce	400.00	72.43	28.97

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-B19 beef before final heating (95% retention trial)	526.32	65.00	34.21
Mozzarella	500.00	UNPRICED	UNPRICED
Onion	100.00	UNPRICED	UNPRICED
Sweet pepper	100.00	UNPRICED	UNPRICED

Known ingredient subtotal: **512.78 FCFA per pilot**. Unpriced or unresolved inputs: Mozzarella, O-B15: Water, O-B16: Black pepper, O-B16: Garlic peeled, O-B16: Onion trimmed, O-B16: Oregano, O-B16: Tomato trimmed, O-B19: Beef boneless, O-B19: Black pepper, O-B19: Cinnamon, O-B19: Coriander, O-B19: Cumin, O-B19: Garlic peeled, O-B19: Lemon juice, O-B19: Onion trimmed, O-B19: Paprika, O-B19: Vinegar 5%, Onion, Sweet pepper. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 51.28 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 5.13 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

Frozen bases and serving formats

O-FBASE1 Gravity soft serve vanilla trial mix

Status: Harmonized source formulation — production trial required

Source: S163; lines 2052-2080.

Pilot input 1,000 g; target usable output 970 g. Planning production batch is x5: input 5,000 g and usable output 4,850 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
UHT milk	660	3,300	—
Cream 35%	100	500	—
Skim milk powder	55	275	—
Sugar	100	500	—
Glucose powder	30	150	—
Condensed milk	50	250	—
Ice cream stabilizer blend	3	15	—
Vanilla	2	10	—

1. Confirm each machine model, feed system and permitted fat, solids, stabilizer and viscosity range before loading. The owner describes one machine as soft serve and the other as gravity; these categories overlap, so the second is provisionally treated as gravity-fed soft serve, with its actual product mode still to be verified. If either manual rejects this mix, use its approved commercial premix until a compatible reformulation is tested.

2. Dry-blend sugar, glucose powder, milk powder and an ice-cream-specific stabilizer/emulsifier blend. The 3 g dose is provisional: follow the actual blend label, offset any dose change with milk and recheck solids.

3. Warm milk and cream, whisk in dry blend, condensed milk and vanilla. Apply the controlled dairy processing protocol C02 before use. Reconstituted milk powder must not be treated as sterile.

4. Cool rapidly, keep covered at 1–4°C and age 4–8 hours as a texture trial if the stabilizer instructions require it. Load only sanitized equipment and cold mix; record input and output weights.

5. Freeze and dispense following the manufacturer’s start-up settings. Begin testing at 30% overrun as a calculation assumption, not a machine guarantee. Never add chunks, coarse nut paste or fruit fibre to a gravity feed hopper.

Yield and process note: 1,000 g mix input; 970 g saleable frozen mass after assumed 3% loss. Estimate 6.2% fat and 35% total solids using stated ingredient compositions. The real machine’s hold-up may exceed this allowance; a 1 kg pilot is a formulation trial, not necessarily a sufficient machine charge.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
UHT milk	66.00
Cream 35%	10.00
Skim milk powder	5.50
Sugar	10.00
Glucose powder	3.00
Condensed milk	5.00
Ice cream stabilizer blend	0.30
Vanilla	0.20

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
UHT milk	660.00	UNPRICED	UNPRICED
Cream 35%	100.00	UNPRICED	UNPRICED

O-FBASE2 Vanilla condensed milk popsicle mix

Status: Harmonized source formulation — production trial required

Source: S163; lines 2081-2106.

Pilot input 1,000 g; target usable output 970 g. Planning production batch is x5: input 5,000 g and usable output 4,850 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
UHT milk	640	3,200	—
Condensed milk	180	900	—
Cream 35%	60	300	—
Sugar	70	350	—
Skim milk powder	45	225	—
Ice cream stabilizer blend	3	15	—
Vanilla	2	10	—

1. Dry-blend sugar, skim powder and stabilizer suitable for frozen bars; verify the blend’s label dose.

2. Warm milk and cream, whisk in dry ingredients and condensed milk, then use F0 dairy processing and rapid chilling.

3. Fill cleaned moulds to their measured working volume, leaving the manufacturer-required expansion space. Insert food-safe sticks and freeze in the popsicle machine according to its manual.

4. Demould with potable-water contact controlled by the machine instructions; bag immediately and transfer to the dedicated hardening/storage freezer. Track yield by weight.

Yield and process note: 1,000 g input; 970 g usable mix after loss. Approximate 6% fat, 35% solids and 15% added sucrose before naturally occurring lactose; recheck labels. No overrun assumed.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
UHT milk	64.00
Condensed milk	18.00
Cream 35%	6.00
Sugar	7.00
Skim milk powder	4.50
Ice cream stabilizer blend	0.30
Vanilla	0.20

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
UHT milk	640.00	UNPRICED	UNPRICED
Condensed milk	180.00	UNPRICED	UNPRICED
Cream 35%	60.00	UNPRICED	UNPRICED
Sugar	70.00	640.00	44.80
Skim milk powder	45.00	UNPRICED	UNPRICED
Ice cream stabilizer blend	3.00	UNPRICED	UNPRICED
Vanilla	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **44.80 FCFA per pilot**. Unpriced or unresolved inputs: Condensed milk, Cream 35%, Ice cream stabilizer blend, Skim milk powder, UHT milk, Vanilla. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. O-FBASE3 Pineapple fruit ice mix

Status: Harmonized source formulation — production trial required

Source: S163; lines 2107-2131.

Pilot input 1,000 g; target usable output 970 g. Planning production batch is x5: input 5,000 g and usable output 4,850 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Pineapple puree pasteurized	500	2,500	—
Water	310	1,550	—
Sugar	140	700	—
Glucose powder	45	225	—
Lemon juice	3	15	—
Ice cream stabilizer blend	2	10	—

1. Use commercially pasteurized puree and potable water. Confirm the stabilizer is suitable for acidic water ices, not simply any dairy stabilizer.

2. Heat water with sugar, glucose and stabilizer according to its hydration instructions, then combine with puree using sanitized equipment. Select a supplier-approved fruit processing schedule; dairy time/temperature guidance is not a fruit-process validation.

3. Chill promptly under C01–C05. Measure soluble solids with a refractometer; a trial target is 22–25 degrees Brix, adjusted for the actual fruit. Reweigh any formula adjustment and re-cost.

4. Fill measured moulds, insert sticks, freeze, demould hygienically, bag and harden. This formula is for moulded ices, not automatically for the soft-serve hopper.

Yield and process note: 1,000 g input; 970 g usable mix. At 12 degrees Brix puree, calculated soluble solids are roughly 24.5% before small acid/stabilizer contributions. Zero milk fat; not dairy ice cream.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Pineapple puree pasteurized	50.00
Water	31.00
Sugar	14.00
Glucose powder	4.50
Lemon juice	0.30
Ice cream stabilizer blend	0.20

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Pineapple puree pasteurized	500.00	UNPRICED	UNPRICED
Water	310.00	UNPRICED	UNPRICED
Sugar	140.00	640.00	89.60
Glucose powder	45.00	UNPRICED	UNPRICED
Lemon juice	3.00	UNPRICED	UNPRICED
Ice cream stabilizer blend	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **89.60 FCFA per pilot**. Unpriced or unresolved inputs: Glucose powder, Ice cream stabilizer blend, Lemon juice, Pineapple puree pasteurized, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-FBASE4 Mango yogurt popsicle mix

Status: Harmonized source formulation — production trial required

Source: S163; lines 2132-2156.

Pilot input 1,000 g; target usable output 970 g. Planning production batch is x5: input 5,000 g and usable output 4,850 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Yogurt plain	500	2,500	—
Mango puree pasteurized	250	1,250	—
Condensed milk	120	600	—
Sugar	70	350	—
Water	58	290	—
Ice cream stabilizer blend	2	10	—

1. Use commercially pasteurized fruit puree and yogurt made from pasteurized milk, kept cold. Use a stabilizer intended for acidic frozen yogurt bars.

2. Hydrate stabilizer with sugar and water according to its instructions, then cool rapidly before blending into the yogurt, puree and condensed milk.

3. Blend with sanitized tools, keep at or below 4°C and fill moulds promptly. Do not claim live-culture counts or probiotic benefits.

4. Freeze, demould, bag and harden as for milk pops. This is a cold-assembled process requiring hygienic ingredients and validated local handling, not a claim of on-site pasteurization.

Yield and process note: 1,000 g input; 970 g usable mix. Provisional solids around 26% and fat around 2.7% using yogurt at 12% solids and 3.5% fat, mango at 15% solids, and the stated condensed milk assumption; actual labels control the final balance.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Yogurt plain	50.00
Mango puree pasteurized	25.00
Condensed milk	12.00
Sugar	7.00
Water	5.80
Ice cream stabilizer blend	0.20

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. O-FBASE5 Chocolate sundae sauce

Status: Harmonized source formulation — production trial required

Source: S163; lines 2157-2181.

Pilot input 955 g; target usable output 900 g. Planning production batch is x5: input 4,775 g and usable output 4,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Water	400	2,000	—
Sugar	250	1,250	—
Cocoa	100	500	—
Condensed milk	200	1,000	—
Salt	2	10	—
Vanilla	3	15	—

1. Whisk cocoa and sugar, gradually add water and bring to a simmer while stirring.

2. Add condensed milk and salt; cook gently to 900 g finished mass without scorching, then add vanilla.

3. Cool under C01–C05 and keep refrigerated in labelled small containers.

4. Serve 20 g cold sauce per sundae; do not return used sauce to the storage batch.

Yield and process note: Input 955 g; about 55 g evaporation. This milk-containing sauce requires refrigeration.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Water	41.88
Sugar	26.18
Cocoa	10.47
Condensed milk	20.94
Salt	0.21
Vanilla	0.31

Total-formula basis: 955.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. O-FBASE6 Soft sandwich cookies

Status: Harmonized source formulation — production trial required

Source: S163; lines 2182-2208.

Pilot input 1,086 g; target usable output 900 g. Planning production batch is x5: input 5,430 g and usable output 4,500 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Plain flour	500	2,500	—
Margarine	220	1,100	—
Sugar	220	1,100	—
Egg	100	500	—
Cocoa	35	175	—
Baking powder	4	20	—
Salt	4	20	—
Vanilla	3	15	—

1. Cream margarine and sugar just until smooth; mix in egg and vanilla.

2. Fold in sifted flour, cocoa, baking powder and salt. Chill 20 minutes, roll 3–4 mm and cut evenly.

3. Bake at 170–180°C for a trial 9–12 minutes until set but not rock-hard. Cool fully; target 900 g baked cookies.

4. Match by diameter. Use two 20 g cookies per ice cream sandwich; record breakage separately.

Yield and process note: Input 1,086 g; expected cooked usable cookies 900 g after bake/trim loss. Verify freezer bite before launch.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	46.04
Margarine	20.26
Sugar	20.26
Egg	9.21
Cocoa	3.22
Baking powder	0.37
Salt	0.37
Vanilla	0.28

Total-formula basis: 1,086.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. O-FBASE7 Chocolate dipping coating

Status: Harmonized source formulation — production trial required

Source: S163; lines 2209-2229.

Pilot input 1,000 g; target usable output 980 g. Planning production batch is x5: input 5,000 g and usable output 4,900 g. These are trial targets; machine minimum/maximum batch capacities remain unverified.

Ingredient or prepared component	Pilot g	Production g	Baker %
Compound chocolate coating	950	4,750	—
Oil	50	250	—

1. Use a commercially supplied compound coating intended for frozen confectionery. Melt only within its manufacturer's temperature range.

2. Add the stated oil only if its instructions allow thinning; otherwise use 1,000 g coating and update cost.

3. Dip fully hardened dry milk bars briefly using clean tools. Keep moisture out of the coating bowl.

4. Return coated bars immediately to frozen storage; do not put unused dipped-product crumbs back into clean coating stock.

Yield and process note: Input 1,000 g; 20 g bowl/handling loss. Remaining coating working stock must be recorded; do not charge it repeatedly if still usable.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Compound chocolate coating	95.00
Oil	5.00

Total-formula basis: 1,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. O-F01 Vanilla soft serve cup or cone

Status: Harmonized source formulation — production trial required

Source: S163; lines 2230-2257.

Quality target: Smooth fine texture, clean vanilla flavour and stable shape for immediate eating.

Portion and pilot yield: 10 x 95 g; 20 g serving remainder. Costed saleable units: 10.

Prepared component	Pilot g	Planning x5 g
O-FBASE1 Gravity soft serve vanilla trial mix	970	4,850

1. Prepare O-FBASE1 under F0 and dispense using the machine manual. Weigh ten 95 g servings; a 20 g residual is charged to the batch.

2. At the illustrative 1.09 g/ml mix density and 30% overrun, 95 g occupies about 113 ml; choose a cup with adequate headroom. A cone is an alternative package, not a second product.

3. Serve immediately. Keep hopper mix cold, log temperatures and follow the specific daily dismantling/sanitation or approved heat-treatment cycle.

Compatibility and yield: Prototype for the reported soft serve and gravity machine arrangement, conditional on both manuals. Chocolate alternative per 1 kg input: replace 25 g milk with 25 g cocoa; recheck viscosity, freezing and cost. No chunk inclusions.

Troubleshooting: Icy: unstable temperature/low solids; weak swirl: formulation or machine setting; sandy: excessive milk solids or storage abuse.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE1 Gravity soft serve vanilla trial mix	100.00

Total-formula basis: 970.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. O-F02 Chocolate peanut sundae

Status: Harmonized source formulation — production trial required

Source: S163; lines 2258-2287.

Quality target: Clean layers, measured topping and crunch without a flooded cup.

Portion and pilot yield: 120 g soft serve + 20 g sauce + 10 g nuts. Costed saleable units: 5.

Prepared component	Pilot g	Planning x5 g
O-FBASE1 Gravity soft serve vanilla trial mix	600	3,000
O-FBASE5 Chocolate sundae sauce	100	500
Peanut roasted	50	250

1. Use O-FBASE1 and fully chilled O-FBASE5; use reputable commercially roasted peanuts, inspect and store dry.

2. Dispense 120 g ice cream into each cup, add 20 g sauce and 10 g nuts with dedicated utensils.

3. Serve immediately. Offer a nut-free recipe only where cross-contact can be controlled; removing visible nuts is insufficient.

Compatibility and yield: A service format from existing soft serve, not an extra freezer formulation. Cost uses five servings, 750 g total.

Troubleshooting: Rapid melt: warm sauce/cup; excessive cost: unmeasured nuts; stale taste: old nuts.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE1 Gravity soft serve vanilla trial mix	80.00
O-FBASE5 Chocolate sundae sauce	13.33
Peanut roasted	6.67

Total-formula basis: 750.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

O-F03 Chocolate milkshake

Status: Harmonized source formulation — production trial required

Source: S163; lines 2288-2317.

Quality target: Drinkable thick consistency, no ice lumps and consistent fill.

Portion and pilot yield: 150 g soft serve + 120 g milk + 20 g sauce. Costed saleable units: 5.

Prepared component	Pilot g	Planning x5 g
O-FBASE1 Gravity soft serve vanilla trial mix	750	3,750
UHT milk	600	3,000
O-FBASE5 Chocolate sundae sauce	100	500

1. Confirm a food-safe high-speed blender is available; the mixing machine/pot alone is not evidence of blending capability.

2. Blend one 150 g ice cream portion with 120 g cold UHT milk and 20 g chilled sauce for 15–25 seconds, until just smooth.

3. Use a roughly 350 ml cup after measuring actual aeration volume. Serve immediately; wash and sanitize blender parts between production sessions and allergens.

Compatibility and yield: Conditional on blender availability. No raw egg. 1,450 g input for five portions; mass 290 g each before trivial blender residue, charged via the loss model.

Troubleshooting: Thin: overblending/warm milk; excessive sweetness: unmeasured syrup; lumps: inadequate blender.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE1 Gravity soft serve vanilla trial mix	51.72
UHT milk	41.38
O-FBASE5 Chocolate sundae sauce	6.90

Total-formula basis: 1,450.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-FBASE1 Gravity soft serve vanilla trial mix	750.00	65.98	49.48
UHT milk	600.00	UNPRICED	UNPRICED
O-FBASE5 Chocolate sundae sauce	100.00	178.21	17.82

Known ingredient subtotal: **67.31 FCFA per pilot**. Unpriced or unresolved inputs: O-FBASE1: Condensed milk, O-FBASE1: Cream 35%, O-FBASE1: Glucose powder, O-FBASE1: Ice cream stabilizer blend, O-FBASE1: Skim milk powder, O-FBASE1: UHT milk, O-FBASE1: Vanilla, O-FBASE5: Cocoa, O-FBASE5: Condensed milk, O-FBASE5: Vanilla, O-FBASE5: Water, UHT milk. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-F04 Chocolate cookie ice cream sandwich

Status: Harmonized source formulation — production trial required

Source: S163; lines 2318-2346.

Quality target: Biteable cookie with a firm clean filling, no large ice crystals.

Portion and pilot yield: 2 x 20 g cookies + 70 g frozen filling. Costed saleable units: 10.

Prepared component	Pilot g	Planning x5 g
O-FBASE6 Soft sandwich cookies	400	2,000
O-FBASE1 Gravity soft serve vanilla trial mix	700	3,500

1. Bake O-FBASE6, cool fully and select twenty 20 g cookies.

2. Dispense or spread O-FBASE1 into clean shallow moulds, portioning 70 g per filling. Harden quickly in suitable freezing equipment; storage-freezer capacity alone does not prove hardening throughput.

3. Sandwich each hardened filling between two cookies, wrap individually and return to frozen storage immediately. Pilot freezer bite and condensation resistance.

Compatibility and yield: Uses soft-serve output hardened in shallow forms; no batch freezer is assumed. Start with small production, and approve only after a recorded hardening test.

Troubleshooting: Hard cookie: overbake; crumbly assembly: unmatched diameter; icy filling: slow hardening.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE6 Soft sandwich cookies	36.36
O-FBASE1 Gravity soft serve vanilla trial mix	63.64

Total-formula basis: 1,100.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-FBASE6 Soft sandwich cookies	400.00	483.23	193.29
O-FBASE1 Gravity soft serve vanilla trial mix	700.00	65.98	46.19

Known ingredient subtotal: **239.48 FCFA per pilot**. Unpriced or unresolved inputs: O-FBASE1: Condensed milk, O-FBASE1: Cream 35%, O-FBASE1: Glucose powder, O-FBASE1: Ice cream stabilizer blend, O-FBASE1: Skim milk powder, O-FBASE1: UHT milk, O-FBASE1: Vanilla, O-FBASE6: Baking powder, O-FBASE6: Cocoa, O-FBASE6: Egg, O-FBASE6: Plain flour, O-FBASE6:

Vanilla. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-F05 Condensed milk popsicles

Status: Harmonized source formulation — production trial required

Source: S163; lines 2347-2374.

Quality target: Creamy clean release and securely centred stick.

Portion and pilot yield: Example small 50 ml mould at density 1.10 g/ml: 55 g each. Costed saleable units: 17.

Prepared component	Pilot g	Planning x5 g
O-FBASE2 Vanilla condensed milk popsicle mix	970	4,850

1. Prepare O-FBASE2 and use the popsicle machine manual for mould immersion, stick timing and freeze completion.

2. At example 50 ml working fill and 1.10 g/ml density, make 17 x 55 g bars, with 35 g remainder. At example 100 ml, make 8 x 110 g bars with 90 g remainder. Actual moulds are unconfirmed.

3. Bag each bar, include the stick cost, and move immediately to hardening/frozen storage. Use F0 storage policy.

Compatibility and yield: One product in two sizes. Larger example price 500 FCFA (test 450–650); separate cost row supplied. Densities and volumes must be measured.

Troubleshooting: Icy: low solids/slow freezing; too soft: excessive sugar; pulled-out stick: incomplete freezing.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE2 Vanilla condensed milk popsicle mix	100.00

Total-formula basis: 970.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-FBASE2 Vanilla condensed milk popsicle mix	970.00	46.19	44.80

Known ingredient subtotal: **44.80 FCFA per pilot**. Unpriced or unresolved inputs: O-FBASE2: Condensed milk, O-FBASE2: Cream 35%, O-FBASE2: Ice cream stabilizer blend, O-FBASE2: Skim milk powder, O-FBASE2: UHT milk, O-FBASE2: Vanilla. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously

frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. O-F06 Pineapple fruit ice pops

Status: Harmonized source formulation — production trial required

Source: S163; lines 2375-2402.

Quality target: Distinct fruit flavour and biteable ice texture, not plain coloured sugar water.

Portion and pilot yield: Example small 50 ml x 1.10 g/ml = 55 g. Costed saleable units: 17.

Prepared component	Pilot g	Planning x5 g
O-FBASE3 Pineapple fruit ice mix	970	4,850

1. Make O-FBASE3; measure fruit solids and density before filling.

2. Use the same illustrative 17 small or 8 large bar yield calculation as O-F05 only if measured density is 1.10 g/ml. Freeze, demould and bag under the machine procedure.

3. Offer the large 100 ml example at 400 FCFA (test 350–500). Keep a separate dairy-contact workflow if marketing as dairy-free.

Compatibility and yield: One product in two sizes. Do not feed this fruit formula into gravity soft serve unless its manual expressly permits it.

Troubleshooting: Rock-hard: too little sugar/solids; sticky soft: excessive Brix; weak fruit: diluted puree.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE3 Pineapple fruit ice mix	100.00

Total-formula basis: 970.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-FBASE3 Pineapple fruit ice mix	970.00	92.37	89.60

Known ingredient subtotal: **89.60 FCFA per pilot**. Unpriced or unresolved inputs: O-FBASE3: Glucose powder, O-FBASE3: Ice cream stabilizer blend, O-FBASE3: Lemon juice, O-FBASE3: Pineapple puree pasteurized, O-FBASE3: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated

cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-F07 Mango yogurt frozen bar

Status: Harmonized source formulation — production trial required

Source: S163; lines 2403-2432.

Quality target: Balanced mango acidity, smooth bite and firm shape.

Portion and pilot yield: Example 70 g bars: 12 units; 130 g remainder. Costed saleable units: 12.

Prepared component	Pilot g	Planning x5 g
O-FBASE4 Mango yogurt popsicle mix	970	4,850

1. Make O-FBASE4 with hygienic ready-to-eat ingredients. Portion 70 g each into a mould with sufficient verified working volume.

2. Freeze promptly, demould hygienically and wrap. Charge the 130 g remainder to the twelve bars until a measured mould/batch combination reduces it.

3. Run a sourness and freezer-bite test; declare milk and do not imply health or live-culture benefits.

Compatibility and yield: Moulded yogurt dessert, not a gravity-machine frozen-yogurt recipe. Approximate 64 ml at 1.10 g/ml density, subject to measurement.

Troubleshooting: Curdled/grainy: acid imbalance; icy: low solids; weak mango: poor puree.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE4 Mango yogurt popsicle mix	100.00

Total-formula basis: 970.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
O-FBASE4 Mango yogurt popsicle mix	970.00	46.19	44.80

Known ingredient subtotal: **44.80 FCFA per pilot**. Unpriced or unresolved inputs: O-FBASE4: Condensed milk, O-FBASE4: Ice cream stabilizer blend, O-FBASE4: Mango puree pasteurized, O-FBASE4: Water, O-FBASE4: Yogurt plain. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously

frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

O-F08 Chocolate dipped peanut milk bar

Status: Harmonized source formulation — production trial required

Source: S163; lines 2433-2462.

Quality target: Thin crisp coating, creamy core and clean wrapper.

Portion and pilot yield: 66 g milk bar + 18 g coating allocation + 5 g peanut. Costed saleable units: 10.

Prepared component	Pilot g	Planning x5 g
O-FBASE2 Vanilla condensed milk popsicle mix	660	3,300
O-FBASE7 Chocolate dipping coating	180	900
Peanut roasted	50	250

1. Freeze ten 66 g O-FBASE2 cores using an appropriately sized mould and harden fully.

2. Use O-FBASE7 following coating supplier temperature instructions; dip dry cold cores quickly. Target 15 g adhering chocolate per bar; the 18 g allocation includes 3 g drips/handling.

3. Sprinkle 5 g roasted peanut on each before coating sets, then wrap and freeze immediately. Keep nuts segregated.

Compatibility and yield: Approximate sale weight 86 g; 30 g coating loss across ten bars is charged. This is an added-value process and allergen burden, not simply a new flavour.

Troubleshooting: Coating falls off: surface frost; thick shell: wrong viscosity; cracking: excessive coating.

Storage and release: follow F0; weigh fill/serving mass, verify cold-chain log, check stick/packaging integrity where applicable, record rejects and disclose milk, gluten, egg or nuts as the recipe requires. Cup/cone, stick/bag and carton prices are separately assumed in costing.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
O-FBASE2 Vanilla condensed milk popsicle mix	74.16
O-FBASE7 Chocolate dipping coating	20.22
Peanut roasted	5.62

Total-formula basis: 890.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Specialist breads pastries meals and cultured dairy

S-B01 Daily French-style baguette

Status: Harmonized source formulation — production trial required

Source: S163; lines 2469-2521.

Long loaf 35–40 cm; one loaf/retail unit. Working steam injection is owner-confirmed; commission pulse duration using the oven manual and rack trials.

Stage: Launch • Fit class 1 • Pilot 5 units • Production example ×10 = 50 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Baguette dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	10,000
Water	660	66.000%	6,600
Salt	20	2.000%	200
Nevada instant dry yeast	5	0.500%	50
TOTAL	1,685	168.500%	16,850

Effective ingredient-water estimate: 66.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,685 g input − 33.7 g handling/unretained (2%) − 247.695 g process loss (15% of post-handling mass) = 1,403.605 g retained. Allocation: 280.721 g finished component per unit. Production retained mass: 14,036.05 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,685 g; modeled losses 281.395 g; net edible output 1,403.605 g = 5 × 280.721 g expected finished units, with no modeled remainder. Production example: 16,850 g input → 14,036.05 g output across 50 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 330.26 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Weigh all water, including any ice, within the formula. Mix flour and water 3 minutes slowly; rest 15 minutes before adding instant yeast and salt.

2. Develop for an initial 3–6 minutes at second speed, stopping at a thin elastic membrane and 24–26°C dough. Record friction; never extend mixing just to meet a clock.

3. Bulk ferment covered 45–60 minutes at 25–27°C; fold once if slack. Divide the usable dough equally into the stated count; rest preshapes 15–20 minutes.

4. Mold gently to 35–40 cm, within actual tray length. Proof 45–75 minutes at 27°C, 75–80% RH, until expanded with slowly returning fingertip indentation.

5. Score 3–5 overlapping cuts at about 30° blade angle. Trial 230°C loading and 215–220°C bake for 20–25 minutes. Use only the oven's approved steam system at loading; vent near the end.

6. Confirm a set crumb, dry sidewalls and a trial center of 96–98°C. Cool uncovered on protected racks until no condensation occurs in the selected paper sleeve. Weigh after cooling.

Quality, defects and controlled variants

Burst sides → short proof or poor scoring: correct proof/end cuts. Flat loaf → overproof/weak dough: shorten wait and assess flour. Leathery crust → inadequate final drying: check approved vent.

For a 250 g finished specification, calculate raw weight from measured bake loss; do not print 250 g based on this theoretical pilot.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	59.35
Water	39.17
Salt	1.19
Nevada instant dry yeast	0.30

Total-formula basis: 1,685.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	660.00	UNPRICED	UNPRICED
Salt	20.00	194.44	3.89
Nevada instant dry yeast	5.00	1,666.67	8.33

Known ingredient subtotal: **432.22 FCFA per pilot**. Unpriced or unresolved inputs: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 86.44 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 8.64 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously

frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. S-B02 Kumba-style soft block loaf

Status: Harmonized source formulation — production trial required

Source: S163; lines 2522-2577.

Four pan loaves per pilot; shape and sweetness must be taste-tested with Nkambe customers.

Stage: Launch • Fit class 2 • Pilot 4 units • Production example ×8 = 32 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	8,000
Water	550	55.000%	4,400
Sugar	100	10.000%	800
Margarine 80%	60	6.000%	480
Skim milk powder	30	3.000%	240
Salt	18	1.800%	144
Nevada instant dry yeast	12	1.200%	96
Nutmeg	2	0.200%	16
TOTAL	1,772	177.200%	14,176

Effective ingredient-water estimate: 56.08% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,772 g input − 35.44 g handling/unretained (2%) − 208.387 g process loss (12% of post-handling mass) = 1,528.173 g retained. Allocation: 382.043 g finished component per unit. Production retained mass: 12,225.382 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,772 g; modeled losses 243.827 g; net edible output 1,528.173 g = 4 × 382.043 g expected finished units, with no modeled remainder. Production example: 14,176 g input → 12,225.382 g output across 32 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 434.14 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Blend flour, water, milk powder, sugar and yeast slowly for 4 minutes. Add salt and margarine; develop 4–7 minutes to smooth extensible dough at 25–27°C.

2. Bulk rest 40–50 minutes, covered. Divide equally, degas evenly and rest 10–15 minutes. Mold a close crumb with progressive roller reduction, never force stiff dough through a narrow gap.

3. Place in greased open loaf tins around 20 × 10 × 8 cm as a first trial; record tin volume. Proof at 28–30°C, 75–80% RH for 60–90 minutes until puffy and approximately approaching the rim.

4. Bake without added steam at 185–195°C for 28–38 minutes. Seek uniform brown sidewalls and 94–96°C crumb; adjust time to measured pan load.

5. Unmold after 5–10 minutes, cool on racks and bag only without condensation. Cut a trial loaf to check fine, soft crumb rather than a compressed wet band.

Quality, defects and controlled variants

Dense gummy center → underproof/underbake. Tearing → insufficient rest. Greasy crumb → fat type or underdevelopment. Correct one variable per trial.

Do not call margarine bread butter bread; replace fat only by a separately reconciled butter trial.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	56.43
Water	31.04
Sugar	5.64
Margarine 80%	3.39
Skim milk powder	1.69
Salt	1.02
Nevada instant dry yeast	0.68
Nutmeg	0.11

Total-formula basis: 1,772.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	550.00	UNPRICED	UNPRICED
Sugar	100.00	640.00	64.00
Margarine 80%	60.00	UNPRICED	UNPRICED
Skim milk powder	30.00	UNPRICED	UNPRICED
Salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Nutmeg	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **507.50 FCFA per pilot**. Unpriced or unresolved inputs: Margarine 80%, Nutmeg, Skim milk powder, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 126.88 FCFA for 4 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 12.69 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-B03 True-butter pain beurre

Status: Harmonized source formulation — production trial required

Source: S163; lines 2578-2631.

Six short loaves; no added coloring and no post-bake raw egg.

Stage: Phase 2 • Fit class 1 • Pilot 6 units • Production example ×8 = 48 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker’s percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	8,000
Water	550	55.000%	4,400
Butter 82%	120	12.000%	960
Sugar	80	8.000%	640
Salt	20	2.000%	160
Nevada instant dry yeast	12	1.200%	96
TOTAL	1,782	178.200%	14,256

Effective ingredient-water estimate: 56.92% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,782 g input − 35.64 g handling/unretained (2%) − 209.563 g process loss (12% of post-handling mass) = 1,536.797 g retained. Allocation: 256.133 g finished component per unit. Production retained mass: 12,294.374 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,782 g; modeled losses 245.203 g; net edible output 1,536.797 g = 6 × 256.133 g expected finished units, with no modeled remainder. Production example: 14,256 g input → 12,294.374 g output across 48 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 291.06 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix flour, water, yeast and sugar 3–4 minutes slowly; add salt and develop until the dough begins to stretch cleanly.

2. Add pliable butter in three additions, mixing until each disappears. Finish at 24–26°C with a smooth membrane, approximately 5–8 additional minutes.

3. Bulk ferment 45–60 minutes at 26°C. Divide, rest 15 minutes and mold six short cylinders about 20–22 cm.

4. Proof 45–75 minutes at 28°C and 75–80% RH until puffy. Make shallow decorative scores without crushing.

5. Bake at 185–195°C, no steam, for 20–28 minutes. Seek 93–96°C crumb, no wet seam and even color; cool fully before bagging.

Quality, defects and controlled variants

Butter leakage → warm or underdeveloped dough. Dark outside/raw inside → reduce setpoint and extend bake. Dry next day → measure loss and pack barrier.

Margarine creates a differently named soft loaf; never use a butter claim for that substitution.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	56.12
Water	30.86
Butter 82%	6.73
Sugar	4.49
Salt	1.12
Nevada instant dry yeast	0.67

Total-formula basis: 1,782.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	550.00	UNPRICED	UNPRICED
Butter 82%	120.00	UNPRICED	UNPRICED
Sugar	80.00	640.00	51.20
Salt	20.00	194.44	3.89
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **495.09 FCFA per pilot**. Unpriced or unresolved inputs: Butter 82%, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 82.51 FCFA for 6 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 8.25 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated

cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-B04 Sandwich pan loaf / pain de mie

Status: Harmonized source formulation — production trial required

Source: S163; lines 2632-2686.

Three loaves; slicer is not assumed. Supply whole loaves or hand-sliced preorder quantities.

Stage: Launch • Fit class 2 • Pilot 3 units • Production example ×8 = 24 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker’s percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	8,000
Water	610	61.000%	4,880
Sugar	50	5.000%	400
Oil	50	5.000%	400
Skim milk powder	30	3.000%	240
Salt	20	2.000%	160
Nevada instant dry yeast	10	1.000%	80
TOTAL	1,770	177.000%	14,160

Effective ingredient-water estimate: 61.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,770 g input − 35.4 g handling/unretained (2%) − 173.46 g process loss (10% of post-handling mass) = 1,561.14 g retained. Allocation: 520.38 g finished component per unit. Production retained mass: 12,489.12 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,770 g; modeled losses 208.86 g; net edible output 1,561.14 g = 3 × 520.38 g expected finished units, with no modeled remainder. Production example: 14,160 g input → 12,489.12 g output across 24 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 578.2 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix dry ingredients and water 4 minutes slowly. Add oil and finish to full windowpane at 25–27°C, initial 5–8 minutes faster.

2. Bulk ferment 45–60 minutes; divide into three equal pieces and bench-rest 15 minutes.

3. Mold tight even cylinders without tearing and put in greased tins around 22 × 11 × 10 cm. Trial lid clearance; pan dimensions are not confirmed equipment.

4. Proof at 28°C, 75–80% RH for about 60–85 minutes; for a lidded loaf close when near 1.5–2 cm below the lid and only after trialing actual pan volume.

5. Bake at 190–200°C for 32–40 minutes without steam. Check 94–96°C crumb, set sidewalls, then unmold and cool completely before manual slicing with a guarded work procedure.

Quality, defects and controlled variants

Waisted sides → early unmolding/underbake. Dense top → lid overfill. Ragged slices → slicing warm or unsuitable knife.

Open-top pan route avoids buying lids immediately; define a distinct pan/load specification.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	56.50
Water	34.46
Sugar	2.82
Oil	2.82
Skim milk powder	1.69
Salt	1.13
Nevada instant dry yeast	0.56

Total-formula basis: 1,770.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-B05 Soft burger buns

Status: Harmonized source formulation — production trial required

Source: S163; lines 2687-2742.

20 buns; no wash or seed in the costed base, simplifying allergens and pickup.

Stage: Launch • Fit class 1 • Pilot 20 units • Production example ×5 = 100 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Soft bun dough

Percent basis: total wheat flour in this component = 100% (baker’s percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	5,000
Water	560	56.000%	2,800
Sugar	80	8.000%	400
Oil	80	8.000%	400
Skim milk powder	40	4.000%	200
Salt	18	1.800%	90
Nevada instant dry yeast	12	1.200%	60
Whole egg	50	5.000%	250
TOTAL	1,840	184.000%	9,200

Effective ingredient-water estimate: 59.80% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,840 g input − 36.8 g handling/unretained (2%) − 216.384 g process loss (12% of post-handling mass) = 1,586.816 g retained. Allocation: 79.341 g finished component per unit. Production retained mass: 7,934.08 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,840 g; modeled losses 253.184 g; net edible output 1,586.816 g = 20 × 79.341 g expected finished units, with no modeled remainder. Production example: 9,200 g input → 7,934.08 g output across 100 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 90.16 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix all ingredients except oil for 4 minutes slowly. Add oil and develop to a smooth windowpane, keeping dough at 25–27°C.

2. Bulk ferment covered 45–60 minutes. Divide the usable dough equally into 20 pieces, round with a sealed base and rest 10 minutes.

3. Flatten to approximately 9 cm; place with at least 3 cm expansion clearance. Proof at 28–30°C, 75–80% RH for 45–70 minutes to a soft slow-return indentation.

4. Bake 13–18 minutes at 185–195°C without steam. Check a set center near 94–96°C. Cool on racks completely before bagging or splitting.

5. Check 10 raw and cooled weights. Test one bun with a hot patty and sauce for 15 minutes; approve softness without base collapse.

Quality, defects and controlled variants

Flat crown → overproof or careless transfer. Splits → tight skin/underproof. Dry bun → too much bake loss.

For sesame variant, add and cost 1 g seed per bun before baking; seeds introduce sesame and may shed. Base recipe excludes them.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	54.35
Water	30.43
Sugar	4.35
Oil	4.35
Skim milk powder	2.17
Salt	0.98
Nevada instant dry yeast	0.65
Whole egg	2.72

Total-formula basis: 1,840.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

S-B06 Professional 50%-butter brioche

Status: Harmonized source formulation — production trial required

Source: S163; lines 2743-2801.

Five plain loaves; original brioche retained and deepened. Not Brioche Vendéenne or a protected-origin claim.

Stage: Phase 2 • Fit class 3 • Pilot 5 units • Production example ×5 = 25 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker’s percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	5,000
Whole egg	500	50.000%	2,500
Butter 82%	500	50.000%	2,500
Sugar	150	15.000%	750
Whole milk 3.5%	100	10.000%	500
Salt	20	2.000%	100
Nevada instant dry yeast	15	1.500%	75
Vanilla	5	0.500%	25
TOTAL	2,290	229.000%	11,450

Effective ingredient-water estimate: 54.75% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 2,290 g input − 45.8 g handling/unretained (2%) − 269.304 g process loss (12% of post-handling mass) = 1,974.896 g retained. Allocation: 394.979 g finished component per unit. Production retained mass: 9,874.48 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,290 g; modeled losses 315.104 g; net edible output 1,974.896 g = 5 × 394.979 g expected finished units, with no modeled remainder. Production example: 11,450 g input → 9,874.48 g output across 25 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 448.84 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Use strong extensible flour (trial 11.5–13% protein), shell-free weighed chilled egg, and block butter. A 2.29 kg pilot needs a suitable small mixer or manual kneading, not an unverified minimum spiral load.

2. Start eggs/milk at 2–5°C and butter pliable at 16–18°C. Mix everything except butter 4–5 minutes slowly then develop until elastic.

3. Add butter in 4–6 portions on low speed; finish only once glossy with a thin windowpane. Aim for 24–26°C dough. Stop and chill if butter oils out; do not add flour to hide melting.

4. Bulk rest 45–60 minutes at 25–26°C. Flatten to 3–4 cm in covered shallow trays and refrigerate at 2–4°C for 8–16 hours. Log center cooling; never chill a deep 11 kg ball.

5. Divide chilled dough into five loaves; divide each loaf into five equal balls. Fit an open pan around 20–22 × 10 × 8 cm. Keep waiting dough chilled.

6. Proof at 26–28°C and 75–80% RH for an initial 2–3 hours until clearly puffy with a slow-return indentation. No free butter may pool below pieces.

7. Bake at 165–175°C, no steam, for about 30–40 minutes; aim for 90–94°C center plus fully set crumb. Color alone is unreliable. Rest 5–10 minutes, unmold and cool.

8. Approve a cut loaf showing fine pull-apart strands and clean butter aroma. Weigh raw and cooled units, record refrigeration occupancy and cost before accepting the premium format.

Quality, defects and controlled variants

Greasy → butter too warm/added too early. Dense → weak gluten or short proof. Burnt top/gummy middle → bake too hot. Collapsed sides → underbake or overproof.

Optional wash: prepare 50 g egg + 5 g milk per pilot, apply before bake only; weigh actual pickup and leftover separately. This is excluded from base mass and cost; base needs no wash.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	43.67
Whole egg	21.83
Butter 82%	21.83
Sugar	6.55
Whole milk 3.5%	4.37
Salt	0.87
Nevada instant dry yeast	0.66
Vanilla	0.22

Total-formula basis: 2,290.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Whole egg	500.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Butter 82%	500.00	UNPRICED	UNPRICED
Sugar	150.00	640.00	96.00
Whole milk 3.5%	100.00	UNPRICED	UNPRICED
Salt	20.00	194.44	3.89
Nevada instant dry yeast	15.00	1,666.67	25.00
Vanilla	5.00	UNPRICED	UNPRICED

Known ingredient subtotal: **544.89 FCFA per pilot**. Unpriced or unresolved inputs: Butter 82%, Vanilla, Whole egg, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 108.98 FCFA for 5 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 10.90 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-B07 Milk bread finger rolls / pain au lait

Status: Harmonized source formulation — production trial required

Source: S163; lines 2802-2855.

24 finger rolls; milk is not interchangeable with the same mass of water without reformulation.

Stage: Launch • Fit class 1 • Pilot 24 units • Production example ×5 = 120 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	5,000
Whole milk 3.5%	640	64.000%	3,200
Sugar	120	12.000%	600
Butter 82%	80	8.000%	400
Salt	18	1.800%	90
Nevada instant dry yeast	12	1.200%	60
TOTAL	1,870	187.000%	9,350

Effective ingredient-water estimate: 57.28% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,870 g input − 37.4 g handling/unretained (2%) − 219.912 g process loss (12% of post-handling mass) = 1,612.688 g retained. Allocation: 67.195 g finished component per unit. Production retained mass: 8,063.44 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,870 g; modeled losses 257.312 g; net edible output 1,612.688 g = 24 × 67.195 g expected finished units, with no modeled remainder. Production example: 9,350 g input → 8,063.44 g output across 120 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 76.358 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix flour, milk, sugar and yeast 4 minutes slowly. Add salt then butter; develop to a supple windowpane at 25–27°C.

2. Ferment covered 45–60 minutes. Divide equally, round, rest 10–15 minutes and roll to 10–12 cm fingers.

3. Proof at 28°C, 75–80% RH for 45–70 minutes until visibly light. Make three shallow snips without deflating.

4. Bake 12–17 minutes at 180–190°C without steam. Check an evenly set 94–96°C center and a thin golden crust.

5. Cool protected on racks; bag without condensation. Weigh a three-roll family pack as well as individual pieces.

Quality, defects and controlled variants

Tough crumb → dusting flour or underhydration. Dark crust → too hot for sugar. Weak proof → yeast not suited to sweet dough.

Vanilla or coconut toppings belong to separately costed variants, not extra strategic products.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, milk.

Cool fully before food-grade bagging; use paper/ventilated protection for crisp baguettes. Label lot and allergens. Covered dry transport; no unvalidated multi-day life. Assess at 0/6/24/48 hours; safety/storage approval remains C05. No reheating is required for the plain product.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	53.48
Whole milk 3.5%	34.22
Sugar	6.42
Butter 82%	4.28
Salt	0.96
Nevada instant dry yeast	0.64

Total-formula basis: 1,870.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

Whole milk 3.5%	640.00	UNPRICED	UNPRICED
Sugar	120.00	640.00	76.80
Butter 82%	80.00	UNPRICED	UNPRICED
Salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **520.30 FCFA per pilot**. Unpriced or unresolved inputs: Butter 82%, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 21.68 FCFA for 24 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.17 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously

frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-P01 Yeast donuts: plain, glazed and beignets sucrés

Status: Harmonized source formulation — production trial required

Source: S163; lines 2856-2924.

30 dough-divided donuts; oil bath charge is not absorbed oil. Record all discarded/filter oil in process consumables.

Stage: Launch • Fit class 1 • Pilot 30 units • Production example ×4 = 120 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Yeast dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	4,000
Water	490	49.000%	1,960
Whole egg	100	10.000%	400
Sugar	100	10.000%	400
Butter 82%	80	8.000%	320
Skim milk powder	30	3.000%	120
Salt	18	1.800%	72
Nevada instant dry yeast	15	1.500%	60
Vanilla	5	0.500%	20
TOTAL	1,838	183.800%	7,352

Effective ingredient-water estimate: 57.88% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,838 g input − 36.76 g handling/unretained (2%) − 216.149 g process loss (12% of post-handling mass) = 1,585.091 g retained. Allocation: 52.836 g finished component per unit. Production retained mass: 6,340.365 g. All losses are unmeasured planning allowances.

Formula — Absorbed frying oil

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Oil	120	100.000%	480
TOTAL	120	100.000%	480

Mass route, pilot: 120 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 120 g retained. Allocation: 4 g finished component per unit. Production retained mass: 480 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,958 g; modeled losses 252.909 g; net edible output 1,705.091 g = 30 × 56.836 g expected finished units, with no modeled remainder. Production example: 7,832 g input → 6,820.365 g output across 120 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 60.041 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix dry ingredients with water and eggs slowly 4 minutes; develop briefly then add butter. Finish smooth at 24–26°C with a thin membrane.

2. Bulk ferment 45–60 minutes. Divide equally into 30 pieces and form rings by opening the center; this avoids uncosted cutter scraps. For solid beignets sucrés, flatten rounds to 10–12 mm.

3. Proof at 28–30°C, 70–75% RH for about 35–55 minutes on transferable screens until light but strong enough to lift.

4. Fry rings at 175°C initial trial, approximately 90–120 seconds per side; solid rounds may need 2–3 minutes per side at 170–175°C. Log recovery between loads.

5. Drain on a rack. Split a first-off sample: no raw flour line or wet center. Verify egg-containing product reaches 75°C for 30 seconds while developing a separate full cooked-crumb quality target.

6. For the costed plain format, pack after steam dissipates. For glaze or sugar finishing use the exact variant allowances below, record pickup and maintain separate SKU costs.

Quality, defects and controlled variants

Greasy → cool oil/overproof/long fry. Black crust/raw center → hot oil or large pieces. Glaze runs → hot donut or thin glaze. Fry offcuts separately, never hide them in yield.

Glaze for 30: icing sugar 240 g + potable water 40 g + glucose syrup 80% solids 15 g + vanilla 2 g = 297 g. Model 20% bowl/drip loss = 237.6 g pickup, 7.92 g/donut; no milk. Sugar finish: charge 120 g caster sugar, model 25% unretained = 90 g pickup, 3 g/donut. Choose one finish; do not add both. Workbook contains separate finish rows.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	51.07
Water	25.03
Whole egg	5.11
Sugar	5.11
Butter 82%	4.09
Skim milk powder	1.53
Salt	0.92
Nevada instant dry yeast	0.77
Vanilla	0.26
Oil	6.13

Total-formula basis: 1,958.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

S-P02 Yeast puff-puff / beignets farine

Status: Harmonized source formulation — production trial required

Source: S163; lines 2925-2989.

60 small beignets = 20 three-piece portions. Pilot raw piece is calculated, not guessed from scoop volume.

Stage: Launch • Fit class 1 • Pilot 60 units • Production example ×4 = 240 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Batter

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	4,000
Water	650	65.000%	2,600
Sugar	120	12.000%	480
Salt	12	1.200%	48
Nevada instant dry yeast	12	1.200%	48
Nutmeg	2	0.200%	8
TOTAL	1,796	179.600%	7,184

Effective ingredient-water estimate: 65.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,796 g input − 35.92 g handling/unretained (2%) − 246.411 g process loss (14% of post-handling mass) = 1,513.669 g retained. Allocation: 25.228 g finished component per unit. Production retained mass: 6,054.675 g. All losses are unmeasured planning allowances.

Formula — Absorbed frying oil

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Oil	150	100.000%	600
TOTAL	150	100.000%	600

Mass route, pilot: 150 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 150 g retained. Allocation: 2.5 g finished component per unit. Production retained mass: 600 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,946 g; modeled losses 282.331 g; net edible output 1,663.669 g = 60 × 27.728 g expected finished units, with no modeled remainder. Production example: 7,784 g input → 6,654.675 g output across 240 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 29.335 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix water, flour, sugar, yeast, salt and nutmeg to a stretchy dropping batter; no dry pockets. Target 26–28°C.

2. Cover and ferment 60–90 minutes at 27–29°C until well aerated and increased about 75% in volume. Do not continuously degas the batter.

3. Use a weighed release scoop to divide equally into the stated count. Trial oil at 170–175°C; fry small loads for 3–5 minutes, turning until evenly browned.

4. Cut samples to verify a fully set elastic center. Drain and weigh oil uptake/loss; keep sweet frying before savory products.

5. Serve near production in a dry paper sleeve, ideally three pieces per purchase. No overnight ambient carryover during trials.

Quality, defects and controlled variants

Sour/flat → overfermentation. Dense → cold batter/inactive yeast. Hollow wet shell → excessive oil heat. Irregular weights → scoop calibration.

BHB bundle is retained as a commercial concept, not counted as a fully developed recipe here; do not add uncosted beans and porridge to the three-piece base.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten.

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	51.39
Water	33.40
Sugar	6.17
Salt	0.62
Nevada instant dry yeast	0.62
Nutmeg	0.10
Oil	7.71

Total-formula basis: 1,946.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

S-P03 Cameroonian cake-style beignets soufflés

Status: Harmonized source formulation — production trial required

Source: S163; lines 2990-3057.

40 cake-like fritters; the name is grounded in S06, but local naming should be checked at the counter.

Stage: Phase 2 • Fit class 1 • Pilot 40 units • Production example ×4 = 160 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Batter

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Plain flour	1,000	100.000%	4,000
Whole egg	400	40.000%	1,600
Whole milk 3.5%	480	48.000%	1,920
Sugar	220	22.000%	880
Oil	100	10.000%	400
Baking powder	20	2.000%	80
Salt	10	1.000%	40
Vanilla	6	0.600%	24
Nutmeg	2	0.200%	8
TOTAL	2,238	223.800%	8,952

Effective ingredient-water estimate: 72.40% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 2,238 g input − 44.76 g handling/unretained (2%) − 307.054 g process loss (14% of post-handling mass) = 1,886.186 g retained. Allocation: 47.155 g finished component per unit. Production retained mass: 7,544.746 g. All losses are unmeasured planning allowances.

Formula — Absorbed frying oil

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Oil	160	100.000%	640
TOTAL	160	100.000%	640

Mass route, pilot: 160 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 160 g retained. Allocation: 4 g finished component per unit. Production retained mass: 640 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,398 g; modeled losses 351.814 g; net edible output 2,046.186 g = 40 × 51.155 g expected finished units, with no modeled remainder. Production example: 9,592 g input → 8,184.746 g output across 160 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 54.831 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Whisk eggs, milk, sugar, oil and vanilla by hand in a suitable bowl; do not assume a spiral mixer can aerate cake batter.

2. Sieve flour with double-acting baking powder, salt and nutmeg. Fold into liquids only until smooth. No yeast fermentation or proofer is used.

3. Deposit promptly with a release scoop into 170–175°C oil. The trial piece count requires equal weighed scoops; fry about 4–6 minutes while turning.

4. Check the center 75°C for 30 seconds and a fully set cakey texture, not simply a dark exterior. If the surface colors too soon, reduce portion size or heat on the next trial.

5. Drain, cool until steam dissipates and pack in a ventilated sleeve. Compare fresh texture with S-P02 in a blind tasting.

Quality, defects and controlled variants

Tough → overmix after flour. Bitter → excess or unsuitable leavener. Raw inside → large scoops/high heat. Flat → exhausted baking powder or delayed frying.

Use only specified double-acting baking powder at the recorded dose; supplier change triggers leavening test. Do not substitute yeast.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	41.70
Whole egg	16.68
Whole milk 3.5%	20.02
Sugar	9.17
Oil	4.17
Baking powder	0.83
Salt	0.42
Vanilla	0.25
Nutmeg	0.08
Oil	6.67

Total-formula basis: 2,398.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Plain flour	1,000.00	UNPRICED	UNPRICED
Whole egg	400.00	UNPRICED	UNPRICED
Whole milk 3.5%	480.00	UNPRICED	UNPRICED
Sugar	220.00	640.00	140.80
Oil	100.00	1,413.04	141.30
Baking powder	20.00	UNPRICED	UNPRICED
Salt	10.00	194.44	1.94
Vanilla	6.00	UNPRICED	UNPRICED
Nutmeg	2.00	UNPRICED	UNPRICED
Oil	160.00	1,413.04	226.09

Known ingredient subtotal: **510.14 FCFA per pilot**. Unpriced or unresolved inputs: Baking powder, Nutmeg, Plain flour, Vanilla, Whole egg, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 12.75 FCFA for 40 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.28 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-P04 Coconut butter biscuits

Status: Harmonized source formulation — production trial required

Source: S163; lines 3058-3112.

80 biscuits; sell four-packs. Budget manual labour; spiral hook is not a creaming paddle.

Stage: Launch • Fit class 2 • Pilot 80 units • Production example ×3 = 240 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Biscuit dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Plain flour	1,000	100.000%	3,000
Butter 82%	550	55.000%	1,650
Icing sugar	350	35.000%	1,050
Whole egg	100	10.000%	300
Desiccated coconut	150	15.000%	450
Salt	5	0.500%	15
Vanilla	5	0.500%	15
TOTAL	2,160	216.000%	6,480

Effective ingredient-water estimate: 16.40% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 2,160 g input − 43.2 g handling/unretained (2%) − 211.68 g process loss (10% of post-handling mass) = 1,905.12 g retained. Allocation: 23.814 g finished component per unit. Production retained mass: 5,715.36 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,160 g; modeled losses 254.88 g; net edible output 1,905.12 g = 80 × 23.814 g expected finished units, with no modeled remainder. Production example: 6,480 g input → 5,715.36 g output across 240 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 26.46 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Use dry fine desiccated coconut, not fresh coconut at the same weight. Cream pliable butter and icing sugar manually for a small trial; use a paddle mixer only if separately available.

2. Add egg gradually and vanilla. Fold in flour, salt and coconut briefly until just bound. Keep dough about 20–23°C; chill briefly if too soft, with safe refrigeration.

3. Divide into 80 portions; press to discs about 5 cm diameter and 6–8 mm thick with 2 cm spacing.

4. Bake at 160–170°C without steam for 14–20 minutes; rotate rack only according to machine safety procedure. Seek evenly golden edges and a dry cooled snap.

5. Cool fully, then seal in moisture-barrier food packs. Conduct water-activity and mold/packaging studies before any multi-day retail shelf-life claim.

Quality, defects and controlled variants

Spread → warm fat or inaccurate flour. Tough → too much mixing. Soft after packing → cooling/poor barrier. Rancid → coconut/butter age.

Fresh coconut introduces water and spoilage risk: reformulate and validate rather than substitute directly.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk, coconut (declare ingredient; verify local allergen classification).

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	46.30
Butter 82%	25.46
Icing sugar	16.20
Whole egg	4.63
Desiccated coconut	6.94
Salt	0.23
Vanilla	0.23

Total-formula basis: 2,160.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Plain flour	1,000.00	UNPRICED	UNPRICED
Butter 82%	550.00	UNPRICED	UNPRICED
Icing sugar	350.00	UNPRICED	UNPRICED
Whole egg	100.00	UNPRICED	UNPRICED
Desiccated coconut	150.00	UNPRICED	UNPRICED
Salt	5.00	194.44	0.97
Vanilla	5.00	UNPRICED	UNPRICED

Known ingredient subtotal: **0.97 FCFA per pilot**. Unpriced or unresolved inputs: Butter 82%, Desiccated coconut, Icing sugar, Plain flour, Vanilla, Whole egg. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 0.01 FCFA for 80 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.00 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Repeat independently before scale-up.

S-P05 Banana snack cake

Status: Harmonized source formulation — production trial required

Source: S163; lines 3113-3170.

32 slices; whole-tray or individually wrapped sale. Use the weighed finished tray for exact cut yield.

Stage: Launch • Fit class 2 • Pilot 32 units • Production example ×3 = 96 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Cake batter

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Plain flour	1,000	100.000%	3,000
Banana pulp	900	90.000%	2,700
Sugar	650	65.000%	1,950
Oil	350	35.000%	1,050
Whole egg	500	50.000%	1,500
Whole milk 3.5%	150	15.000%	450
Baking powder	25	2.500%	75
Salt	10	1.000%	30
Cinnamon	5	0.500%	15
Vanilla	5	0.500%	15
TOTAL	3,595	359.500%	10,785

Effective ingredient-water estimate: 51.12% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 3,595 g input − 71.9 g handling/unretained (2%) − 422.772 g process loss (12% of post-handling mass) = 3,100.328 g retained. Allocation: 96.885 g finished component per unit. Production retained mass: 9,300.984 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 3,595 g; modeled losses 494.672 g; net edible output 3,100.328 g = 32 × 96.885 g expected finished units, with no modeled remainder. Production example: 10,785 g input → 9,300.984 g output across 96 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 110.097 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Prepare peeled ripe but sound banana; reject moldy fruit, and do not use a baking step to rescue spoiled ingredients. Mash to uniform pulp.

2. Whisk egg, sugar, oil, milk, banana and vanilla. Sieve flour, baking powder, salt and cinnamon; fold briefly into the wet mixture. Avoid intentional aeration with a spiral hook.

3. Distribute into lined shallow tins to about 3 cm raw depth; record actual tin area and fill mass. Do not pour the whole production batch into one deep pan.

4. Bake at 160–170°C, no steam, for about 30–45 minutes. Seek a set resilient center, clean skewer and initial quality target 95–98°C.

5. Cool protected, remove liners and divide the measured finished cake into 32 equal slices. The mass balance includes a 2% combined bowl/cutting reject allowance; record actual trimming separately.

Quality, defects and controlled variants

Gummy line → too deep/underbaked/excess banana moisture. Tunnel → overmix. Crumbling → hot cutting or overbake.

No cream cheese or custard icing in the base. Sugar reductions change structure and need a new trial.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	27.82
Banana pulp	25.03

S-P06 Cinnamon breakfast rolls

Status: Harmonized source formulation — production trial required

Source: S163; lines 3171-3238.

24 unglazed rolls. Filling loss is modeled separately from dough loss.

Stage: Phase 2 • Fit class 1 • Pilot 24 units • Production example ×4 = 96 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	1,000	100.000%	4,000
Whole milk 3.5%	520	52.000%	2,080
Whole egg	100	10.000%	400
Sugar	120	12.000%	480
Butter 82%	120	12.000%	480
Salt	18	1.800%	72
Nevada instant dry yeast	15	1.500%	60
TOTAL	1,893	189.300%	7,572

Effective ingredient-water estimate: 55.02% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 1,893 g input − 37.86 g handling/unretained (2%) − 222.617 g process loss (12% of post-handling mass) = 1,632.523 g retained. Allocation: 68.022 g finished component per unit. Production retained mass: 6,530.093 g. All losses are unmeasured planning allowances.

Formula — Cinnamon filling

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Butter 82%	150	40.984%	600
Sugar	200	54.645%	800
Cinnamon	16	4.372%	64
TOTAL	366	100.000%	1,464

Mass route, pilot: 366 g input − 7.32 g handling/unretained (2%) − 43.042 g process loss (12% of post-handling mass) = 315.638 g retained. Allocation: 13.152 g finished component per unit. Production retained mass: 1,262.554 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,259 g; modeled losses 310.838 g; net edible output 1,948.162 g = 24 × 81.173 g expected finished units, with no modeled remainder. Production example: 9,036 g input → 7,792.646 g output across 96 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 77.297 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix and develop dough, adding butter after initial gluten formation, to 24–26°C. Bulk ferment covered 45–60 minutes.

2. Blend filling butter, sugar and cinnamon until spreadable. Rest dough 10–15 minutes then roll to about 6 mm, using the mini sheeter only after thickness and safety checks.

3. Spread the filling evenly, leaving a clean 1 cm edge. Roll a 48 cm log and cut 24 pieces approximately 2 cm wide. Divide into two logs if bench size requires.

4. Proof at 28°C, 75–80% RH for 45–65 minutes until rolls touch lightly and spring back slowly. Do not squeeze out filling.

5. Bake at 175–185°C for 20–28 minutes without steam. Check center rolls are fully set, near 93–96°C, not wet around the spiral. Cool protected before packing.

Quality, defects and controlled variants

Loose spiral → poor seam or uneven filling. Burnt sugar bottom → excess filling/lower heat issue. Dense center → short proof or shallow browning mistaken for doneness.

Optional water glaze uses S-P01 exact glaze recipe scaled to desired pickup; cost as an extra. No cream icing is included.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Pack only after steam/condensation is controlled. Dry sleeves for immediate fried sales, sealed barrier packs for fully cooled biscuits/cake. During pilots use fresh same-day sales; C05 retained samples and relevant water-activity/microbial review set any later life. Reheating is not a preservation method.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	44.27
Whole milk 3.5%	23.02
Whole egg	4.43
Sugar	5.31
Butter 82%	5.31
Salt	0.80
Nevada instant dry yeast	0.66
Butter 82%	6.64
Sugar	8.85
Cinnamon	0.71

Total-formula basis: 2,259.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

S-F01 Complete beef hamburger

Status: Harmonized source formulation — production trial required

Source: S163; lines 3239-3336.

10 complete burgers, not ten buns. Cheese upgrade: 20 g separately costed per unit; no fries in base.

Stage: Phase 2 • Fit class 3 • Pilot 10 units • Production example ×5 = 50 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Soft bun dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	500	100.000%	2,500
Water	280	56.000%	1,400
Sugar	40	8.000%	200
Oil	40	8.000%	200
Skim milk powder	20	4.000%	100
Salt	9	1.800%	45
Nevada instant dry yeast	6	1.200%	30
Whole egg	25	5.000%	125
TOTAL	920	184.000%	4,600

Effective ingredient-water estimate: 59.80% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 920 g input − 18.4 g handling/unretained (2%) − 108.192 g process loss (12% of post-handling mass) = 793.408 g retained. Allocation: 79.341 g finished component per unit. Production retained mass: 3,967.04 g. All losses are unmeasured planning allowances.

Formula — Seasoned beef patty

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Raw beef mince	1,000	98.814%	5,000
Salt	10	0.988%	50
Black pepper	2	0.198%	10
TOTAL	1,012	100.000%	5,060

Mass route, pilot: 1,012 g input − 0 g handling/unretained (0%) − 253 g process loss (25% of post-handling mass) = 759 g retained. Allocation: 75.9 g finished component per unit. Production retained mass: 3,795 g. All losses are unmeasured planning allowances.

Formula — Burger sauce

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Pasteurized-egg mayonnaise	120	60.000%	600
Ketchup	50	25.000%	250
Mustard	20	10.000%	100
Drained pickle	10	5.000%	50
TOTAL	200	100.000%	1,000

Mass route, pilot: 200 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 200 g retained. Allocation: 20 g finished component per unit. Production retained mass: 1,000 g. All losses are unmeasured planning allowances.

Formula — Prepared salad

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Lettuce	100	20.000%	500
Tomato	200	40.000%	1,000
Onion	100	20.000%	500
Drained pickle	100	20.000%	500
TOTAL	500	100.000%	2,500

Mass route, pilot: 500 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 500 g retained. Allocation: 50 g finished component per unit. Production retained mass: 2,500 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,632 g; modeled losses 379.592 g; net edible output 2,252.408 g = 10 × 225.241 g expected finished units, with no modeled remainder. Production example: 13,160 g input → 11,262.04 g output across 50 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 90.16 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Make the listed half-size S-B05 dough and divide into ten buns; follow S-B05 proof and bake. Cool completely. If using stock buns, transfer their actual batch cost and do not charge fresh dough too.

2. Keep beef at 4°C or below. Shape ten equal patties about 10–11 cm wide; do not knead heavily. Season just before cooking.

3. Mix the 200 g sauce with clean utensils in the ready-to-eat zone and refrigerate; prepare washed, drained vegetables separately from raw beef.

4. In a suitable induction pan, trial a 190–210°C pan surface and 3–4 minutes each side. Probe the patty sideways to verify 75°C for 30 seconds; measured temperature overrides minutes.

5. Toast bun faces. For each burger add one patty, 20 g sauce, 10 g lettuce, 20 g tomato, 10 g onion and 10 g pickle. Serve immediately.

6. Weigh cooked patties: the 25% cook loss is a planning estimate. If the output differs, record the actual portion and recost; do not present raw 100 g as cooked 100 g.

Quality, defects and controlled variants

Wet base → undrained vegetables/excess sauce. Tough patty → overworking/pressing. Slow queue → too many cooked-to-order products for one pan.

Serve a smaller verified-price format only after recalculating bun/patty/salad portions; never change advertised meat weight silently.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, mustard, milk.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	19.00
Water	10.64
Sugar	1.52
Oil	1.52
Skim milk powder	0.76
Salt	0.34
Nevada instant dry yeast	0.23
Whole egg	0.95
Raw beef mince	37.99
Salt	0.38
Black pepper	0.08
Pasteurized-egg mayonnaise	4.56
Ketchup	1.90
Mustard	0.76
Drained pickle	0.38
Lettuce	3.80
Tomato	7.60
Onion	3.80
Drained pickle	3.80

Total-formula basis: 2,632.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	500.00	420.00	210.00
Water	280.00	UNPRICED	UNPRICED
Sugar	40.00	640.00	25.60
Oil	40.00	1,413.04	56.52
Skim milk powder	20.00	UNPRICED	UNPRICED
Salt	9.00	194.44	1.75
Nevada instant dry yeast	6.00	1,666.67	10.00
Whole egg	25.00	UNPRICED	UNPRICED
Raw beef mince	1,000.00	UNPRICED	UNPRICED
Salt	10.00	194.44	1.94
Black pepper	2.00	UNPRICED	UNPRICED
Pasteurized-egg mayonnaise	120.00	UNPRICED	UNPRICED
Ketchup	50.00	UNPRICED	UNPRICED
Mustard	20.00	UNPRICED	UNPRICED
Drained pickle	10.00	UNPRICED	UNPRICED
Lettuce	100.00	UNPRICED	UNPRICED
Tomato	200.00	UNPRICED	UNPRICED
Onion	100.00	UNPRICED	UNPRICED
Drained pickle	100.00	UNPRICED	UNPRICED

Known ingredient subtotal: **305.82 FCFA per pilot**. Unpriced or unresolved inputs: Black pepper, Drained pickle, Ketchup, Lettuce, Mustard, Onion, Pasteurized-egg mayonnaise, Raw beef mince, Skim milk powder, Tomato, Water, Whole egg. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 30.58 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.06 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification; Mustard Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____;

rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-F02 Pain omelette with sardines

Status: Harmonized source formulation — production trial required

Source: S163; lines 3337-3418.

Ten compact sandwiches; bread size is smaller than the old 125 g half-loaf. Re-price and label accordingly.

Stage: Phase 2 • Fit class 3 • Pilot 10 units • Production example ×5 = 50 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Baguette dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	500	100.000%	2,500
Water	330	66.000%	1,650
Salt	10	2.000%	50
Nevada instant dry yeast	2.5	0.500%	12.5
TOTAL	842.5	168.500%	4,212.5

Effective ingredient-water estimate: 66.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 842.5 g input − 16.85 g handling/unretained (2%) − 123.847 g process loss (15% of post-handling mass) = 701.803 g retained. Allocation: 70.18 g finished component per unit. Production retained mass: 3,509.012 g. All losses are unmeasured planning allowances.

Formula — Omelette

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole egg	500	52.356%	2,500
Drained sardines	200	20.942%	1,000
Onion	80	8.377%	400
Tomato	100	10.471%	500
Sweet pepper	40	4.188%	200
Oil	30	3.141%	150
Salt	4	0.419%	20
Black pepper	1	0.105%	5
TOTAL	955	100.000%	4,775

Mass route, pilot: 955 g input − 0 g handling/unretained (0%) − 114.6 g process loss (12% of post-handling mass) = 840.4 g retained. Allocation: 84.04 g finished component per unit. Production retained mass: 4,202 g. All losses are unmeasured planning allowances.

Formula — Sandwich sauce

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Pasteurized-egg mayonnaise	70	70.000%	350
Ketchup	30	30.000%	150
TOTAL	100	100.000%	500

Mass route, pilot: 100 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 100 g retained. Allocation: 10 g finished component per unit. Production retained mass: 500 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,897.5 g; modeled losses 255.297 g; net edible output 1,642.202 g = 10 × 164.22 g expected finished units, with no modeled remainder. Production example: 9,487.5 g input → 8,211.012 g output across 50 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 82.565 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Bake the listed half-size S-B01 dough as five short baguettes and cool. Split each into two portions; the card models ten bread portions.

2. Open intact tins, drain and weigh sardines; cost drained fish, not gross tin weight. Refrigerate opened fish. Sweat onion and pepper in some of the listed oil, add tomato and cook off free water.

3. Per order use 50 g shell-free egg, 20 g fish and one-tenth of cooked vegetables, seasoning and remaining oil. Keep raw egg mix chilled and away from finished sandwiches.

4. Cook in a clean induction pan, fold to fit bread and verify 75°C for 30 seconds at the egg center. A starting 3–5 minutes is only a trial timing.

5. Toast bread lightly, apply 10 g sauce and add one omelette. Serve immediately; do not store warm assembled sandwiches in an ambient display.

Quality, defects and controlled variants

Soggy bread → watery vegetables. Fishy pastry cross-odor → poor separation. Rubbery egg → excessive pan time after safe endpoint.

Egg-only version omits fish and changes total weight/cost/allergen declarations; use a separate SKU record.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, fish.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	26.35
Water	17.39
Salt	0.53
Nevada instant dry yeast	0.13
Whole egg	26.35

S-F03 Beef-and-cheese filled bread

Status: Harmonized source formulation — production trial required

Source: S163; lines 3419-3506.

Ten sealed filled buns; raw beef is included, so there is no hidden cooked-meat purchasing assumption.

Stage: Phase 2 • Fit class 3 • Pilot 10 units • Production example ×5 = 50 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Unbaked bun dough

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	500	100.000%	2,500
Water	280	56.000%	1,400
Sugar	40	8.000%	200
Oil	40	8.000%	200
Skim milk powder	20	4.000%	100
Salt	9	1.800%	45
Nevada instant dry yeast	6	1.200%	30
Whole egg	25	5.000%	125
TOTAL	920	184.000%	4,600

Effective ingredient-water estimate: 59.80% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 920 g input − 18.4 g handling/unretained (2%) − 108.192 g process loss (12% of post-handling mass) = 793.408 g retained. Allocation: 79.341 g finished component per unit. Production retained mass: 3,967.04 g. All losses are unmeasured planning allowances.

Formula — Beef filling

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Raw beef mince	500	56.754%	2,500
Onion	100	11.351%	500
Carrot	80	9.081%	400
Sweet pepper	80	9.081%	400
Oil	20	2.270%	100
Tomato paste	30	3.405%	150
Water	50	5.675%	250
Garlic	10	1.135%	50
Salt	8	0.908%	40

Ingredient / specification	Pilot g	Percent	Production g
Paprika	3	0.341%	15
TOTAL	881	100.000%	4,405

Mass route, pilot: 881 g input − 0 g handling/unretained (0%) − 220.25 g process loss (25% of post-handling mass) = 660.75 g retained. Allocation: 66.075 g finished component per unit. Production retained mass: 3,303.75 g. All losses are unmeasured planning allowances.

Formula — Cheese

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Low-moisture cheese	100	100.000%	500
TOTAL	100	100.000%	500

Mass route, pilot: 100 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 100 g retained. Allocation: 10 g finished component per unit. Production retained mass: 500 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 1,901 g; modeled losses 346.842 g; net edible output 1,554.158 g = 10 × 155.416 g expected finished units, with no modeled remainder. Production example: 9,505 g input → 7,770.79 g output across 50 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 90.16 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Brown beef and verify 75°C for 30 seconds. Add the diced vegetables, oil, garlic, paste, water and seasonings; cook until cohesive with no free liquid. Weigh yield, then actively cool under C01.

2. Mix the bun dough using S-B05, but do not prebake. Bulk ferment 45–60 minutes, divide into ten, rest 10–15 minutes and flatten to 12–14 cm discs.

3. Keep filling and cheese at 4°C or below until needed. Fill with one-tenth of the measured chilled filling plus 10 g cheese; leave a clean border and seal seam down.

4. Proof only a timed small load, initially 30–45 minutes at 28°C. Track cumulative filling time outside refrigeration; have an oven slot ready.

5. Bake immediately at 180–190°C for 20–28 minutes, no steam, and verify 75°C for 30 seconds in the filling as well as a set bread shell.

6. Use monitored hot holding or active cooling, never the ordinary bread display. The model assigns 25% filling cook/evaporation and 12% shell bake loss; measure filling loss again in the final bake and revise.

Quality, defects and controlled variants

Burst seam → dirty edge/wet filling. Gummy collar → filling too wet or underbake. Dark shell/cold filling → lower bake heat and verify center.

Cooked chicken substitution requires a new raw-to-cooked yield and poultry process; not a gram-for-gram raw meat swap.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

S-F04 Chicken shawarma wrap

Status: Harmonized source formulation — production trial required

Source: S163; lines 3507-3606.

Ten wraps. No unlisted grill, fries, purchased tortilla or shared raw-meat tank is assumed.

Stage: Phase 2 • Fit class 3 • Pilot 10 units • Production example ×5 = 50 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Flatbread

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	600	100.000%	3,000
Water	330	55.000%	1,650
Oil	30	5.000%	150
Salt	12	2.000%	60
TOTAL	972	162.000%	4,860

Effective ingredient-water estimate: 55.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 972 g input − 19.44 g handling/unretained (2%) − 95.256 g process loss (10% of post-handling mass) = 857.304 g retained. Allocation: 85.73 g finished component per unit. Production retained mass: 4,286.52 g. All losses are unmeasured planning allowances.

Formula — Marinated chicken

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Raw chicken thigh	1,200	80.808%	6,000
Plain pasteurized yogurt	100	6.734%	500
Oil	30	2.020%	150
Onion	60	4.040%	300
Lime juice	30	2.020%	150
Garlic	18	1.212%	90
Ginger	10	0.673%	50
Paprika	10	0.673%	50
Cumin	6	0.404%	30
Black pepper	3	0.202%	15
Salt	18	1.212%	90
TOTAL	1,485	100.000%	7,425

Mass route, pilot: 1,485 g input − 0 g handling/unretained (0%) − 445.5 g process loss (30% of post-handling mass) = 1,039.5 g retained. Allocation: 103.95 g finished component per unit. Production retained mass: 5,197.5 g. All losses are unmeasured planning allowances.

Formula — Garlic sauce

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Pasteurized-egg mayonnaise	140	70.000%	700
Plain pasteurized yogurt	50	25.000%	250
Cooked garlic puree	10	5.000%	50
TOTAL	200	100.000%	1,000

Mass route, pilot: 200 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 200 g retained. Allocation: 20 g finished component per unit. Production retained mass: 1,000 g. All losses are unmeasured planning allowances.

Formula — Salad

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Cabbage	150	42.857%	750
Carrot	100	28.571%	500
Tomato	100	28.571%	500
TOTAL	350	100.000%	1,750

Mass route, pilot: 350 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 350 g retained. Allocation: 35 g finished component per unit. Production retained mass: 1,750 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 3,007 g; modeled losses 560.196 g; net edible output 2,446.804 g = 10 × 244.68 g expected finished units, with no modeled remainder. Production example: 15,035 g input → 12,234.02 g output across 50 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 95.256 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix flatbread to medium development, 24–26°C, then rest covered 30 minutes. Divide into ten equal portions and rest 15 minutes. Roll to 2 mm and about 22–25 cm using measured thickness.

2. Cook on a heavy induction pan with a trial surface 220–240°C, approximately 45–75 seconds each side, until brown spots and no raw layer. Stack briefly under a clean cover for flexibility.

3. Marinate chicken in the listed ingredients in a dedicated raw-meat container at 4°C or below, 4–12 hours. Never use the dairy pot for raw marinade.

4. Use the shawarma machine only after verifying its minimum cone load and operating method. A small trial may be below that minimum: cook chicken in a pan instead. Probe 75°C for 30 seconds; shave only cooked layers and finish shavings on the pan when required. Never partially cook and save a raw-core cone for the next day.

5. Mix sauce only in the clean zone. Assemble one wrap with one-tenth cooked chicken, 20 g sauce and 35 g dry salad; fold ends inward and roll firmly.

6. Serve immediately in food paper. Log chicken yield: the 30% combined meat/marinade loss is a trial allowance, not measured meat-only shrinkage.

Quality, defects and controlled variants

Cracked wrap → overcooked/thick bread. Watery filling → poor drainage. Undercooked shavings → cone/shaving rate mismatch; stop and finish cook.

Shawarma baguette variant uses S-B01 and changes bread mass/cost. Keep fries as a separate option, not part of the base claim.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, egg, milk.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Bread flour	19.95
Water	10.97
Oil	1.00
Salt	0.40
Raw chicken thigh	39.91
Plain pasteurized yogurt	3.33
Oil	1.00
Onion	2.00
Lime juice	1.00
Garlic	0.60
Ginger	0.33
Paprika	0.33
Cumin	0.20
Black pepper	0.10
Salt	0.60
Pasteurized-egg mayonnaise	4.66
Plain pasteurized yogurt	1.66
Cooked garlic puree	0.33
Cabbage	4.99
Carrot	3.33
Tomato	3.33

Total-formula basis: 3,007.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	600.00	420.00	252.00
Water	330.00	UNPRICED	UNPRICED
Oil	30.00	1,413.04	42.39
Salt	12.00	194.44	2.33
Raw chicken thigh	1,200.00	UNPRICED	UNPRICED
Plain pasteurized yogurt	100.00	UNPRICED	UNPRICED
Oil	30.00	1,413.04	42.39
Onion	60.00	UNPRICED	UNPRICED
Lime juice	30.00	UNPRICED	UNPRICED
Garlic	18.00	UNPRICED	UNPRICED
Ginger	10.00	UNPRICED	UNPRICED
Paprika	10.00	UNPRICED	UNPRICED
Cumin	6.00	UNPRICED	UNPRICED
Black pepper	3.00	UNPRICED	UNPRICED
Salt	18.00	194.44	3.50
Pasteurized-egg mayonnaise	140.00	UNPRICED	UNPRICED
Plain pasteurized yogurt	50.00	UNPRICED	UNPRICED
Cooked garlic puree	10.00	UNPRICED	UNPRICED
Cabbage	150.00	UNPRICED	UNPRICED
Carrot	100.00	UNPRICED	UNPRICED
Tomato	100.00	UNPRICED	UNPRICED

Known ingredient subtotal: **342.62 FCFA per pilot**. Unpriced or unresolved inputs: Black pepper, Cabbage, Carrot, Cooked garlic puree, Cumin, Garlic, Ginger, Lime juice, Onion, Paprika, Pasteurized-egg mayonnaise, Plain pasteurized yogurt, Raw chicken thigh, Tomato, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 34.26 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.43 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-F05 Vegetable samosas

Status: Harmonized source formulation — production trial required

Source: S163; lines 3607-3689.

30 medium samosas with fully quantified shell/filling. Pilot oil absorption is 3 g each, to be weighed.

Stage: Phase 2 • Fit class 3 • Pilot 30 units • Production example ×4 = 120 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Pastry

Percent basis: total wheat flour in this component = 100% (baker's percentage).

Ingredient / specification	Pilot g	Percent	Production g
Plain flour	600	100.000%	2,400
Water	250	41.667%	1,000
Oil	60	10.000%	240
Salt	9	1.500%	36
TOTAL	919	153.167%	3,676

Effective ingredient-water estimate: 41.67% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 919 g input − 18.38 g handling/unretained (2%) − 108.074 g process loss (12% of post-handling mass) = 792.546 g retained. Allocation: 26.418 g finished component per unit. Production retained mass: 3,170.182 g. All losses are unmeasured planning allowances.

Formula — Vegetable filling

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Peeled potato	800	62.598%	3,200
Peas	160	12.520%	640
Carrot	100	7.825%	400
Onion	140	10.955%	560
Oil	40	3.130%	160
Garlic	10	0.782%	40
Ginger	10	0.782%	40
Cumin	6	0.469%	24
Salt	12	0.939%	48
TOTAL	1,278	100.000%	5,112

Mass route, pilot: 1,278 g input − 0 g handling/unretained (0%) − 127.8 g process loss (10% of post-handling mass) = 1,150.2 g retained. Allocation: 38.34 g finished component per unit. Production retained mass: 4,600.8 g. All losses are unmeasured planning allowances.

Formula — Absorbed frying oil

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Oil	90	100.000%	360
TOTAL	90	100.000%	360

Mass route, pilot: 90 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 90 g retained. Allocation: 3 g finished component per unit. Production retained mass: 360 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,287 g; modeled losses 254.254 g; net edible output 2,032.746 g = 30 × 67.758 g expected finished units, with no modeled remainder. Production example: 9,148 g input → 8,130.982 g output across 120 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 30.021 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Rub oil into flour and salt; add water, knead to a firm smooth dough and rest covered 30 minutes. Avoid full bread-like gluten development.

2. Steam or boil potato pieces to complete tenderness and drain. Sauté onion, carrot, garlic and ginger in the listed oil; add peas, potato, cumin and salt. Reduce until dry. Treat cooking water as a separately measured process input/drain, not saleable mass.

3. Weigh filling and cool safely if not used immediately. Divide pastry into 30 portions; sheet to about 1.5–2 mm. Form cones or folded triangles.

4. Allocate one-thirtieth of the filling per shell. Seal using water from a small clean brush, weighing any added sealing water in the actual batch log. Pinch a 1 cm clean seam with no trapped air.

5. Fry at 170–175°C for about 4–6 minutes, turn, drain on racks and check the filling reheats to 75°C for 30 seconds when previously chilled.

6. Pack in a vented sleeve for prompt sale or use C01 hot/chilled controls. A potato filling is not automatically safe at room temperature because it has no meat.

Quality, defects and controlled variants

Blisters/burst → wet filling/air/weak seam. Greasy → low oil temperature. Hard pastry → overkneaded or too thick.

A baked version is a new trial (about 195–205°C); remove absorption allowance and add measured surface oil. Do not carry fried yield into baked claims.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Plain flour	26.24
Water	10.93
Oil	2.62
Salt	0.39
Peeled potato	34.98
Peas	7.00
Carrot	4.37
Onion	6.12
Oil	1.75
Garlic	0.44
Ginger	0.44
Cumin	0.26
Salt	0.52
Oil	3.94

Total-formula basis: 2,287.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active pilot labour; total elapsed time is the sum of the process stages above plus measured cooling/holding time. Log both separately; equipment capacity and batch handwork can change these estimates substantially.

S-F06 Mini chicken pizzas

Status: Harmonized source formulation — production trial required

Source: S163; lines 3690-3796.

Twelve snack pizzas; all toppings are included. A deck-style char is not promised from the rotary oven.

Stage: Phase 2 • Fit class 3 • Pilot 12 units • Production example ×4 = 48 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Pizza dough

Percent basis: total wheat flour in this component = 100% (baker’s percentage).

Ingredient / specification	Pilot g	Percent	Production g
Bread flour	500	100.000%	2,000
Water	300	60.000%	1,200
Oil	15	3.000%	60
Sugar	10	2.000%	40
Salt	10	2.000%	40
Nevada instant dry yeast	5	1.000%	20
TOTAL	840	168.000%	3,360

Effective ingredient-water estimate: 60.00% of flour, assuming egg 76%, milk 87.5%, butter 16% and margarine 18% water. Flour moisture is excluded; supplier data supersedes assumptions. This is not the volume of liquid to add.

Mass route, pilot: 840 g input − 16.8 g handling/unretained (2%) − 82.32 g process loss (10% of post-handling mass) = 740.88 g retained. Allocation: 61.74 g finished component per unit. Production retained mass: 2,963.52 g. All losses are unmeasured planning allowances.

Formula — Tomato sauce

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Tomato	240	83.916%	960
Onion	30	10.490%	120
Oil	8	2.797%	32
Garlic	4	1.399%	16
Salt	3	1.049%	12
Oregano	1	0.350%	4
TOTAL	286	100.000%	1,144

Mass route, pilot: 286 g input − 0 g handling/unretained (0%) − 57.2 g process loss (20% of post-handling mass) = 228.8 g retained. Allocation: 19.067 g finished component per unit. Production retained mass: 915.2 g. All losses are unmeasured planning allowances.

Formula — Chicken

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Raw chicken thigh	500	96.525%	2,000
Oil	10	1.931%	40
Salt	5	0.965%	20
Paprika	3	0.579%	12
TOTAL	518	100.000%	2,072

Mass route, pilot: 518 g input − 0 g handling/unretained (0%) − 145.04 g process loss (28% of post-handling mass) = 372.96 g retained. Allocation: 31.08 g finished component per unit. Production retained mass: 1,491.84 g. All losses are unmeasured planning allowances.

Formula — Cheese topping

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Low-moisture cheese	300	100.000%	1,200
TOTAL	300	100.000%	1,200

Mass route, pilot: 300 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 300 g retained. Allocation: 25 g finished component per unit. Production retained mass: 1,200 g. All losses are unmeasured planning allowances.

Formula — Vegetable topping

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Sweet pepper	100	50.000%	400
Onion	100	50.000%	400
TOTAL	200	100.000%	800

Mass route, pilot: 200 g input − 0 g handling/unretained (0%) − 20 g process loss (10% of post-handling mass) = 180 g retained. Allocation: 15 g finished component per unit. Production retained mass: 720 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,144 g; modeled losses 321.36 g; net edible output 1,822.64 g = 12 × 151.887 g expected finished units, with no modeled remainder. Production example: 8,576 g input → 7,290.56 g output across 48 units. Display rounding is not label-weight verification.

Raw dough/batter allocation before bake/fry: 68.6 g per final unit, excluding other components. Filling/glaze/oil are separate above.

Numbered production method

1. Mix dough 3 minutes slowly then 4–6 minutes to elasticity at 24–26°C. Bulk ferment 45–60 minutes, divide into twelve and rest 15–20 minutes.

2. Simmer tomato sauce ingredients to a thick spoon-coating consistency; weigh actual output. Cook seasoned chicken to 75°C for 30 seconds, weigh cooked output, cool both by C01.

3. Lightly sauté/roast topping vegetables and drain. Keep components at 4°C or below. Stretch each dough piece to 12–14 cm and dock the center.

4. Allocate one-twelfth of each component, including 25 g cheese, to each base. Bake immediately at 210–220°C for 10–15 minutes, no steam.

5. Verify reheated chicken topping reaches 75°C for 30 seconds and base is cooked, not wet. Serve promptly in a vented box; cost actual cheese and chicken yield.

Quality, defects and controlled variants

Wet base → thin sauce/too much topping/weak bottom heat. Bubbles → undocked base. Tough rim → excess dusting flour.

Vegetarian variant removes chicken and must have a new mass/cost card, not the same advertised serving weight.

Allergens, packing, life study and costing

Allergens/ingredients to declare: wheat/gluten, milk.

Serve promptly in a vented food-grade pack or use C01 monitored hot/chilled holding and delivery. Cold components stay at 4°C or below; reheated prepared fillings reach 75°C for 30 seconds. Test eating quality at 15/30 minutes. No ambient overnight sale and no unvalidated chilled shelf-life claim.

Sweet pepper	100.00	UNPRICED	UNPRICED
Onion	100.00	UNPRICED	UNPRICED

Known ingredient subtotal: **274.86 FCFA per pilot**. Unpriced or unresolved inputs: Garlic, Low-moisture cheese, Onion, Oregano, Paprika, Raw chicken thigh, Sweet pepper, Tomato, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 22.91 FCFA for 12 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.29 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____;

rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-D01 Vanilla dairy soft serve

Status: Harmonized source formulation — production trial required

Source: S163; lines 3797-3855.

20 mass-based portions from a 2 kg mix pilot. Cup volume depends on actual overrun and density.

Stage: Cold-line phase • Fit class 3 • Pilot 20 units • Production example ×5 = 100 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dairy mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	1,400	70.000%	7,000
Cream 35%	100	5.000%	500
Skim milk powder	110	5.500%	550
Sugar	280	14.000%	1,400
Dextrose anhydrous	60	3.000%	300
STAB 2000	9	0.450%	45
Vanilla	8	0.400%	40
Water	33	1.650%	165
TOTAL	2,000	100.000%	10,000

Mass route, pilot: 2,000 g input − 40 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 1,960 g retained. Allocation: 98 g finished component per unit. Production retained mass: 9,800 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,000 g; modeled losses 40 g; net edible output 1,960 g = 20 × 98 g expected finished units, with no modeled remainder. Production example: 10,000 g input → 9,800 g output across 100 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 4.26%, milk solids-not-fat 11.82%, total solids 33.52%, unfermented lactose 6.38%; added sucrose 14.00% and anhydrous dextrose 3.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 19.70. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. Confirm the machine accepts this fat/solids range, has a safely refrigerated hopper and a documented cleaning method. Use homogenized pasteurized/UHT dairy, not raw milk.

2. Blend STAB 2000 with part of the sugar; disperse with all other ingredients and hydrate as specified in C02. Follow the verified supplier heat requirements and a validated batch heat process.

3. C02 reference for a qualified batch vessel is at least 69°C throughout for 30 minutes. Record the cold point and hold continuously, then cool rapidly to 4°C or below; never rely on the pot display alone.

4. Age covered at 2–4°C for 4–12 hours as a trial texture window. Reblend gently without air, load cold into a cleaned and sanitized machine following its manual.

5. Trial draw near -5 to -7°C only if the manufacturer supports it. Weigh an equal-volume mix and draw sample to measure overrun; compare 25–40% trial overrun without changing machine internals.

6. Portion by mass; serve immediately. The 2% transfer/purge allowance must be replaced with actual start-up and closing waste. Do not top up a dirty hopper or carry mix overnight without a validated manufacturer process.

Quality, defects and controlled variants

Icy → low solids/slow freezing/heat shock. Greasy → fat destabilization or unsuitable machine. Weak peak → over-soft draw/incorrect sugars. Sanitation failure → stop sale, quarantine, clean and investigate.

Cocoa trial is a variant, not a second shortlist item: replace 30 g milk with 30 g cocoa per 2 kg pilot, then re-balance and verify viscosity. Do not add acid fruit directly to hopper dairy.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Portion into food-grade cups/cones at immediate service; packaging is a separate cost. Mix remains under machine/manual cold controls; no ambient retail transport or unvalidated overnight carry. Evaluate draw, purge, sanitation and holding limits before sale.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	70.00
Cream 35%	5.00
Skim milk powder	5.50
Sugar	14.00
Dextrose anhydrous	3.00
STAB 2000	0.45
Vanilla	0.40
Water	1.65

Total-formula basis: 2,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	1,400.00	UNPRICED	UNPRICED
Cream 35%	100.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Skim milk powder	110.00	UNPRICED	UNPRICED
Sugar	280.00	640.00	179.20
Dextrose anhydrous	60.00	UNPRICED	UNPRICED
STAB 2000	9.00	UNPRICED	UNPRICED
Vanilla	8.00	UNPRICED	UNPRICED
Water	33.00	UNPRICED	UNPRICED

Known ingredient subtotal: **179.20 FCFA per pilot**. Unpriced or unresolved inputs: Cream 35%, Dextrose anhydrous, STAB 2000, Skim milk powder, Vanilla, Water, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 8.96 FCFA for 20 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.90 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-D02 Scoopable vanilla ice cream

Status: Harmonized source formulation — production trial required

Source: S163; lines 3856-3913.

22 scoops by mass from 2.2 kg pilot; no cones are included in mass or ingredients.

Stage: Investment phase • Fit class 3 • Pilot 22 units • Production example ×5 = 110 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dairy mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	1,170	53.182%	5,850
Cream 35%	520	23.636%	2,600
Skim milk powder	90	4.091%	450
Sugar	280	12.727%	1,400
Dextrose anhydrous	60	2.727%	300
STAB 2000	6	0.273%	30
Vanilla	8	0.364%	40
Water	66	3.000%	330
TOTAL	2,200	100.000%	11,000

Mass route, pilot: 2,200 g input − 44 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 2,156 g retained. Allocation: 98 g finished component per unit. Production retained mass: 10,780 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,200 g; modeled losses 44 g; net edible output 2,156 g = 22 × 98 g expected finished units, with no modeled remainder. Production example: 11,000 g input → 10,780 g output across 110 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 10.17%, milk solids-not-fat 10.04%, total solids 35.95%, unfermented lactose 5.41%; added sucrose 12.73% and anhydrous dextrose 2.73%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 17.91. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. This product requires a batch freezer plus rapid hardening and storage: it is not automatically made by the soft-serve machine.

2. Prepare the listed mix under C02 using specified dairy and STAB 2000; heat-treatment validation and rapid cooling apply. Age at 2–4°C for 4–12 hours.

3. Batch-freeze at the manufacturer's permitted fill volume. Trial extraction around -6 to -8°C and 25–40% overrun; do not use the mixer rating to choose freezer load.

4. Pack immediately in shallow lidded food tubs; harden in an appropriately rated hardener until core is -18°C or colder. Trial hardener air around -30 to -35°C only within its manual.

5. Store at -18°C or colder, minimizing door opening. A warmer display temperature, initially about -12 to -14°C for texture testing, needs its own controlled time/temperature plan. Do not repeatedly melt and refreeze returns.

Quality, defects and controlled variants

Coarse ice → slow hardening/heat shock. Sandy → excess lactose/solids or storage. Buttery → overchurning. Shrinkage → unstable air structure; verify mix and draw.

This dairy product has over 10% modeled fat, unlike the lower-fat soft-serve mix. Legal product naming still requires local confirmation.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Wrap sticks/bars in freezer-grade film or lid scoop tubs immediately, with batch/net mass/allergens. Store and distribute at -18°C or colder under measured control. No reheating, thaw/refreeze sales or assumed month-long life. Study days 0/7/14/28, crystal size, melt, seal and microbial plan under C05.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	53.18
Cream 35%	23.64
Skim milk powder	4.09
Sugar	12.73
Dextrose anhydrous	2.73
STAB 2000	0.27
Vanilla	0.36
Water	3.00

Total-formula basis: 2,200.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

S-I01 Pineapple-ginger fruit popsicle

Status: Harmonized source formulation — production trial required

Source: S163; lines 3914-3970.

25 × 78.4 g theoretical net sticks; check mold volume at actual mix density before filling.

Stage: Cold-line phase • Fit class 3 • Pilot 25 units • Production example ×5 = 125 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Fruit mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Pasteurized pineapple juice 12 Brix	1,400	70.000%	7,000
Water	290	14.500%	1,450
Sugar	250	12.500%	1,250
Dextrose anhydrous	40	2.000%	200
Treated ginger juice	10	0.500%	50
Pasteurized lime juice	4	0.200%	20
Super Neutrose	6	0.300%	30
TOTAL	2,000	100.000%	10,000

Mass route, pilot: 2,000 g input − 40 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 1,960 g retained. Allocation: 78.4 g finished component per unit. Production retained mass: 9,800 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,000 g; modeled losses 40 g; net edible output 1,960 g = 25 × 78.4 g expected finished units, with no modeled remainder. Production example: 10,000 g input → 9,800 g output across 125 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 0.00%, milk solids-not-fat 0.00%, total solids 23.23%, unfermented lactose 0.00%; added sucrose 12.50% and anhydrous dextrose 2.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 16.30. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. Use documented pasteurized juice or a separately validated local fruit process; do not freeze untreated juice and call it safe. Weigh solids and verify juice °Brix.

2. Premix Super Neutrose with sugar, disperse in formula liquids, rest 15 minutes and heat according to the supplier's hydration instructions. Any whole-mix pathogen-control step must be validated for actual pH, pulp and equipment (C03).

3. Cool rapidly to 4°C or below. Hold covered 2–4 hours for a trial hydration period. Measure °Brix at calibration temperature; the formula predicts roughly 23%, but fruit sugar composition is variable.

4. Fill clean molds by mass, respecting expansion headspace. Insert food-grade sticks centered and deep enough for support. Freeze using the actual machine manual, not an assumed 20-minute cycle.

5. Demold only once cores are fully frozen and sticks hold. Use controlled potable-water release without water entering molds; bag promptly and maintain -18°C or colder.

Quality, defects and controlled variants

Hard/icy → insufficient sugar or heat shock. Sticky/soft → too much sugar or warm freezer. Loose stick → early extraction. Burn from ginger → dose/strength variation.

Mango/passionfruit are future variants only after Brix, acidity and solids rebalancing; same weight does not mean same freezing behavior.

Allergens, packing, life study and costing

Allergens/ingredients to declare: No major allergen intentionally added; verify all labels and shared equipment.

Wrap sticks/bars in freezer-grade film or lid scoop tubs immediately, with batch/net mass/allergens. Store and distribute at -18°C or colder under measured control. No reheating, thaw/refreeze sales or assumed month-long life. Study days 0/7/14/28, crystal size, melt, seal and microbial plan under C05.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Pasteurized pineapple juice 12 Brix	70.00
Water	14.50
Sugar	12.50
Dextrose anhydrous	2.00
Treated ginger juice	0.50
Pasteurized lime juice	0.20
Super Neutrose	0.30

Total-formula basis: 2,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

S-I02 Bissap-ginger-lime ice stick

Status: Harmonized source formulation — production trial required

Source: S163; lines 3971-4027.

25 × 78.4 g net sticks; the old 65°Brix syrup mismatch is removed by direct weighed sugars.

Stage: Cold-line phase • Fit class 3 • Pilot 25 units • Production example ×5 = 125 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Infusion mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Validated hibiscus infusion	1,500	75.000%	7,500
Water	44	2.200%	220
Sugar	380	19.000%	1,900
Dextrose anhydrous	50	2.500%	250
Treated ginger juice	10	0.500%	50
Pasteurized lime juice	10	0.500%	50
Super Neutrose	6	0.300%	30
TOTAL	2,000	100.000%	10,000

Mass route, pilot: 2,000 g input − 40 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 1,960 g retained. Allocation: 78.4 g finished component per unit. Production retained mass: 9,800 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,000 g; modeled losses 40 g; net edible output 1,960 g = 25 × 78.4 g expected finished units, with no modeled remainder. Production example: 10,000 g input → 9,800 g output across 125 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 0.00%, milk solids-not-fat 0.00%, total solids 21.85%, unfermented lactose 0.00%; added sucrose 19.00% and anhydrous dextrose 2.50%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 23.75. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. For the infusion process input, use 30 g food-grade dried hibiscus and 1,600 g potable water. Boil/simmer as a flavour extraction trial for 5–10 minutes, strain hygienically and weigh 1,500 g infusion. Record retained liquid, spent solids and vapor separately; extraction alone is not a validated commercial kill step.

2. Use only a validated treated infusion for commercial manufacture. Cost its actual dry flowers, water, labor and extraction losses as one input; never treat 1,500 g infusion as 1,500 g dry hibiscus.

3. Premix stabilizer and sugar, combine with all liquids and hydrate according to C03. Verify a suitable whole-mix treatment with the process specialist. Measure pH and °Brix, initially about 21.5% added sugars before native extract solids.

4. Cool rapidly to 4°C or below, rest 2–4 hours covered and fill molds by mass. Freeze and demold using the machine-specific checks in S-I01.

5. Wrap against dehydration, record stick and film lots and store at -18°C or colder. Compare ginger heat and acidity with customers in a controlled trial.

Quality, defects and controlled variants

Weak color → old flowers/dilution. Harsh astringency → too much extraction. Soft stick → sugar excess. Ice crystals → slow freeze/storage cycles.

No claim that acidity eliminates pathogens. A ready pasteurized hibiscus base is a lower-complexity commissioning option if documented and affordable.

Allergens, packing, life study and costing

Allergens/ingredients to declare: No major allergen intentionally added; verify all labels and shared equipment.

Wrap sticks/bars in freezer-grade film or lid scoop tubs immediately, with batch/net mass/allergens. Store and distribute at -18°C or colder under measured control. No reheating, thaw/refreeze sales or assumed month-long life. Study days 0/7/14/28, crystal size, melt, seal and microbial plan under C05.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Validated hibiscus infusion	75.00
Water	2.20
Sugar	19.00
Dextrose anhydrous	2.50
Treated ginger juice	0.50
Pasteurized lime juice	0.50
Super Neutrose	0.30

Total-formula basis: 2,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Validated hibiscus infusion	1,500.00	UNPRICED	UNPRICED
Water	44.00	UNPRICED	UNPRICED
Sugar	380.00	640.00	243.20
Dextrose anhydrous	50.00	UNPRICED	UNPRICED
Treated ginger juice	10.00	UNPRICED	UNPRICED
Pasteurized lime juice	10.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Super Neutrose	6.00	UNPRICED	UNPRICED

Known ingredient subtotal: **243.20 FCFA per pilot**. Unpriced or unresolved inputs: Dextrose anhydrous, Pasteurized lime juice, Super Neutrose, Treated ginger juice, Validated hibiscus infusion, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 9.73 FCFA for 25 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.97 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-I03 Cocoa milk popsicle

Status: Harmonized source formulation — production trial required

Source: S163; lines 4028-4084.

25 × 78.4 g modeled sticks, no overrun intended.

Stage: Cold-line phase • Fit class 3 • Pilot 25 units • Production example ×5 = 125 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Cocoa mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	1,450	72.500%	7,250
Water	150	7.500%	750
Sugar	270	13.500%	1,350
Skim milk powder	60	3.000%	300
Cocoa powder	60	3.000%	300
STAB 2000	8	0.400%	40
Vanilla	2	0.100%	10
TOTAL	2,000	100.000%	10,000

Mass route, pilot: 2,000 g input − 40 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 1,960 g retained. Allocation: 78.4 g finished component per unit. Production retained mass: 9,800 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,000 g; modeled losses 40 g; net edible output 1,960 g = 25 × 78.4 g expected finished units, with no modeled remainder. Production example: 10,000 g input → 9,800 g output across 125 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 2.90%, milk solids-not-fat 9.38%, total solids 28.75%, unfermented lactose 5.04%; added sucrose 13.50% and anhydrous dextrose 0.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 13.50. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. Use fine unsweetened cocoa with stated fat content and pasteurized/UHT milk. Premix cocoa, sugar, milk powder and STAB 2000, then disperse completely with the liquids.

2. Apply C02 validated mix heating/cooling. A stick blender can disperse particles but is not a pressure homogenizer. Check the bottom for scorching.

3. Age covered 4–12 hours at 2–4°C; reblend gently. Fill clean molds by mass, leaving tested headspace and inserting centered sticks.

4. Freeze by actual machine endpoint, not merely elapsed time. Demold fully hardened sticks, wrap promptly and store at -18°C or colder.

5. Assess bite from the actual freezer: target firm but not tooth-hard. Measure top/bottom cocoa uniformity and no gritty sediment.

Quality, defects and controlled variants

Grit → poor dispersion/cocoa grade. Sediment → insufficient hydration. Ice hardness → sugar/solids imbalance. Gumminess → excessive stabilizer.

Do not replace 8 g STAB with 8 g starch; they are different systems. Coconut milk version requires separate fat/emulsion balance and label.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Wrap sticks/bars in freezer-grade film or lid scoop tubs immediately, with batch/net mass/allergens. Store and distribute at -18°C or colder under measured control. No reheating, thaw/refreeze sales or assumed month-long life. Study days 0/7/14/28, crystal size, melt, seal and microbial plan under C05.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	72.50
Water	7.50
Sugar	13.50
Skim milk powder	3.00
Cocoa powder	3.00
STAB 2000	0.40
Vanilla	0.10

Total-formula basis: 2,000.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	1,450.00	UNPRICED	UNPRICED
Water	150.00	UNPRICED	UNPRICED
Sugar	270.00	640.00	172.80
Skim milk powder	60.00	UNPRICED	UNPRICED
Cocoa powder	60.00	UNPRICED	UNPRICED
STAB 2000	8.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Vanilla	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **172.80 FCFA per pilot**. Unpriced or unresolved inputs: Cocoa powder, STAB 2000, Skim milk powder, Vanilla, Water, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 6.91 FCFA for 25 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.69 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-I04 Own-brand premium chocolate-coated ice-cream bar

Status: Harmonized source formulation — production trial required

Source: S163; lines 4085-4155.

28 bars: 77 g center + 13.5 g shell = 90.5 g theoretical net. No external brand/logo reproduced.

Stage: Investment phase • Fit class 3 • Pilot 28 units • Production example ×5 = 140 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Dairy mix

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	1,170	53.182%	5,850
Cream 35%	520	23.636%	2,600
Skim milk powder	90	4.091%	450
Sugar	280	12.727%	1,400
Dextrose anhydrous	60	2.727%	300
STAB 2000	6	0.273%	30
Vanilla	8	0.364%	40
Water	66	3.000%	330
TOTAL	2,200	100.000%	11,000

Mass route, pilot: 2,200 g input − 44 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 2,156 g retained. Allocation: 77 g finished component per unit. Production retained mass: 10,780 g. All losses are unmeasured planning allowances.

Formula — Ice-chocolate shell

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Callebaut Ice Chocolate White	420	100.000%	2,100
TOTAL	420	100.000%	2,100

Mass route, pilot: 420 g input − 42 g handling/unretained (10%) − 0 g process loss (0% of post-handling mass) = 378 g retained. Allocation: 13.5 g finished component per unit. Production retained mass: 1,890 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,620 g; modeled losses 86 g; net edible output 2,534 g = 28 × 90.5 g expected finished units, with no modeled remainder. Production example: 13,100 g input → 12,670 g output across 140 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (center only; coating excluded): fat 10.17%, milk solids-not-fat 10.04%, total solids 35.95%, unfermented lactose 5.41%; added sucrose 12.73% and anhydrous dextrose 2.73%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Freezing comparison only: sucrose-equivalent added-sugar index = sucrose% + 1.9 × anhydrous dextrose% = 17.91. This is NOT a full PAC/freezing-point prediction: native fruit sugars, lactose, salts, actual solids and overrun also matter. Confirm bite/draw at the real freezer temperatures; never adjust sugar without recalculating solids and rerunning the freeze test.

Numbered production method

1. Make the complete S-D02 center mix under C02, batch-freeze at a controlled low overrun (trial 20–30%) and immediately fill sanitized bar molds by mass.

2. Allocate the usable center evenly to 28 molds; insert sticks to a reproducible depth with at least roughly two-thirds of center length supported. Actual mold geometry must permit this without protrusion.

3. Harden to a measured core of -18°C or colder in a rated hardener. Demold small batches and keep remaining bars frozen; ordinary popsicle equipment is not assumed to aerate/fill this center.

4. Melt the specified Callebaut Ice Chocolate White to 35–40°C according to its product guidance. It is a special ice coating; no conventional tempering is required for this product. Keep water/condensation out.

5. Dip briefly, drain and weigh shell pickup. Model 420 g working shell input, 42 g unretained/unusable and 378 g on bars (13.5 g each). A deeper dip vessel may require extra reusable working stock, tracked separately as inventory.

6. Let the shell set while the core remains frozen, wrap individually in freezer-grade film and return immediately to -18°C or colder. Check stick pullout, shell cracks and package seal.

7. Do not use Magnum branding or imply its proprietary recipe. A own-brand dark/compound version needs its exact supplier’s melt instructions, label, pickup and allergen trial.

Quality, defects and controlled variants

Thick shell → cold/high-viscosity coating. Sliding shell → surface ice/condensation. Cracks → warm core or thermal shock. Loose stick → incomplete hardening.

Ordinary couverture follows its own tempering curve; compound coating follows its fat-system instructions. Neither can inherit this special ice-chocolate temperature blindly.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Wrap sticks/bars in freezer-grade film or lid scoop tubs immediately, with batch/net mass/allergens. Store and distribute at -18°C or colder under measured control. No reheating, thaw/refreeze sales or assumed month-long life. Study days 0/7/14/28, crystal size, melt, seal and microbial plan under C05.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	44.66
Cream 35%	19.85
Skim milk powder	3.44
Sugar	10.69
Dextrose anhydrous	2.29
STAB 2000	0.23
Vanilla	0.31
Water	2.52
Callebaut Ice Chocolate White	16.03

Total-formula basis: 2,620.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	1,170.00	UNPRICED	UNPRICED
Cream 35%	520.00	UNPRICED	UNPRICED

Vanilla	8.00	UNPRICED	UNPRICED
Water	66.00	UNPRICED	UNPRICED
Callebaut Ice Chocolate White	420.00	UNPRICED	UNPRICED

Known ingredient subtotal: **179.20 FCFA per pilot**. Unpriced or unresolved inputs: Callebaut Ice Chocolate White, Cream 35%, Dextrose anhydrous, STAB 2000, Skim milk powder, Vanilla, Water, Whole milk 3.5%. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 6.40 FCFA for 28 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.64 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-Y01 Plain set yogurt

Status: Harmonized source formulation — production trial required

Source: S163; lines 4156-4211.

20 cups, theoretical 104.174 g net each. Package by verified net mass; do not imply 100 ml equals 100 g.

Stage: Cold-line phase • Fit class 3 • Pilot 20 units • Production example ×10 = 200 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Yogurt base

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	2,060	96.896%	20,600
Skim milk powder	60	2.822%	600
Yogourmet Original 3g sachet	6	0.282%	60
TOTAL	2,126	100.000%	21,260

Mass route, pilot: 2,126 g input − 42.52 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 2,083.48 g retained. Allocation: 104.174 g finished component per unit. Production retained mass: 20,834.8 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,126 g; modeled losses 42.52 g; net edible output 2,083.48 g = 20 × 104.174 g expected finished units, with no modeled remainder. Production example: 21,260 g input → 20,834.8 g output across 200 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 3.42%, milk solids-not-fat 11.40%, total solids 15.10%, unfermented lactose 6.12%; added sucrose 0.00% and anhydrous dextrose 0.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Lactose is the pre-fermentation estimate; acidification changes sugars/acids. These pilot formulas intentionally use no added stabilizer. Culture performance, pH curve and separation are checked, not assumed from a yogurt name.

Numbered production method

1. Use documented homogenized pasteurized/UHT whole milk and skim milk powder. Milk basis is 2 L assumed at 1.030 kg/L, giving 2,060 g; verify actual density and sachet label.

2. Disperse milk powder without foam and heat under C04 to 90–95°C for 5 minutes throughout as a technical yogurt-milk treatment. Validate cold point and covered evaporation; this is not proof from the stirrer display.

3. Cool promptly to 42–44°C, add two complete current 3 g Yogourmet Original sachets, dispersing in a little treated milk then mixing back. Do not use old 5 g-pack instructions or backslop retail yogurt.

4. Fill sanitized food cups and cover before incubation. Incubate undisturbed at 42–44°C; take hygienic sample cups for pH measurement. Start checking after 3 hours; about 5 hours is a supplier timing guide, not release criteria.

5. End incubation at pH 4.5 or the qualified culture-specific endpoint; initiate rapid cooling. C04 requires monitored cooling to 4°C or below in a mapped small-cup process.

6. Refrigerate and retain samples; do not ship at ambient temperature. Verify pH again after cooling, clean mild aroma and intact gel without whey pooling.

Quality, defects and controlled variants

No acidification → inactive culture/inhibitors/wrong temperature: quarantine, do not extend indefinitely. Whey → excessive heat movement/overacidification. Grainy → solids poor dispersion.

Commercial DVS culture may be more economical at scale, but choose a named supplier with units-per-batch instructions and rewrite the dose; no gram-for-gram replacement.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Seal in sanitized food-grade cups/bottles with tamper evidence; transport at 4°C or below with logs. No reheating for ordinary yogurt. Study days 0/1/3/7 with a qualified laboratory, not an assigned 7-day sale life. Do not taste gas-producing or suspect samples.

Culture check: the retained 6 g entry assumes two 3 g sachets for 2 L milk. Verify sachet mass and current regional supplier instructions before manufacture; a different culture is not substituted gram for gram.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	96.90
Skim milk powder	2.82
Yogourmet Original 3g sachet	0.28

Total-formula basis: 2,126.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	2,060.00	UNPRICED	UNPRICED
Skim milk powder	60.00	UNPRICED	UNPRICED
Yogourmet Original 3g sachet	6.00	UNPRICED	UNPRICED

Known ingredient subtotal: **0.00 FCFA per pilot**. Unpriced or unresolved inputs: Skim milk powder, Whole milk 3.5%, Yogourmet Original 3g sachet. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 0.00 FCFA for 20 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.00 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously

frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. S-Y02 Stirred mango yogurt

Status: Harmonized source formulation — production trial required

Source: S163; lines 4212-4279.

Twenty stirred fruit cups; fruit treatment is an explicit gate. Model fruit evaporation as zero in covered processing; measure and revise.

Stage: Cold-line phase • Fit class 3 • Pilot 20 units • Production example ×10 = 200 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Yogurt base

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	2,060	92.543%	20,600
Skim milk powder	60	2.695%	600
Yogourmet Original 3g sachet	6	0.270%	60
Sugar	100	4.492%	1,000
TOTAL	2,226	100.000%	22,260

Mass route, pilot: 2,226 g input − 44.52 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 2,181.48 g retained. Allocation: 109.074 g finished component per unit. Production retained mass: 21,814.8 g. All losses are unmeasured planning allowances.

Formula — Fruit preparation

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Pasteurized mango puree 15 Brix	200	71.429%	2,000
Sugar	80	28.571%	800
TOTAL	280	100.000%	2,800

Mass route, pilot: 280 g input − 0 g handling/unretained (0%) − 0 g process loss (0% of post-handling mass) = 280 g retained. Allocation: 14 g finished component per unit. Production retained mass: 2,800 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,506 g; modeled losses 44.52 g; net edible output 2,461.48 g = 20 × 123.074 g expected finished units, with no modeled remainder. Production example: 25,060 g input → 24,614.8 g output across 200 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 2.90%, milk solids-not-fat 9.67%, total solids 21.19%, unfermented lactose 5.19%; added sucrose 7.18% and anhydrous dextrose 0.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Lactose is the pre-fermentation estimate; acidification changes sugars/acids. These pilot formulas intentionally use no added stabilizer. Culture performance, pH curve and separation are checked, not assumed from a yogurt name.

Numbered production method

1. Make the listed sweet yogurt base with S-Y01 heating and culture controls, but incubate in a sanitized covered fermentation vessel rather than final cups. Obtain supplier confirmation for the sweetened, fortified adaptation.

2. Ferment at 42–44°C and measure pH in hygienically drawn samples. Stop at pH 4.5 by prompt cooling; gently break the gel, avoiding froth.

3. Use an aseptic ready-to-eat mango puree. Dissolve the fruit-stage sugar hygienically in a portion of heated puree and apply a separately validated fruit preparation treatment; do not add unvalidated raw fruit after fermentation.

4. Cool fruit preparation to 4°C or below. Gently blend all 280 g into the cooled yogurt base; record loss, pH and fruit distribution. Do not dilute to replace missing dairy yield.

5. Fill sanitized cups, seal and keep at 4°C or below. Run pH, yeast/mold and sensory trials before setting any commercial storage life.

Quality, defects and controlled variants

Whey separation → overacidification/aggressive stirring. Fermented fruit odor/gas → contamination: reject and investigate. Uneven color → poor gentle blending.

Pineapple is not a direct swap: fruit enzyme, acidity and heat treatment differ. Use separately treated fruit and rebalance.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Seal in sanitized food-grade cups/bottles with tamper evidence; transport at 4°C or below with logs. No reheating for ordinary yogurt. Study days 0/1/3/7 with a qualified laboratory, not an assigned 7-day sale life. Do not taste gas-producing or suspect samples.

Culture check: the retained 6 g entry assumes two 3 g sachets for 2 L milk. Verify sachet mass and current regional supplier instructions before manufacture; a different culture is not substituted gram for gram.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	82.20
Skim milk powder	2.39
Yogourmet Original 3g sachet	0.24
Sugar	3.99
Pasteurized mango puree 15 Brix	7.98
Sugar	3.19

Total-formula basis: 2,506.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner’s stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	2,060.00	UNPRICED	UNPRICED
Skim milk powder	60.00	UNPRICED	UNPRICED
Yogourmet Original 3g sachet	6.00	UNPRICED	UNPRICED
Sugar	100.00	640.00	64.00
Pasteurized mango puree 15 Brix	200.00	UNPRICED	UNPRICED
Sugar	80.00	640.00	51.20

Known ingredient subtotal: **115.20 FCFA per pilot**. Unpriced or unresolved inputs: Pasteurized mango puree 15 Brix, Skim milk powder, Whole milk 3.5%, Yogourmet Original 3g sachet. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 5.76 FCFA for 20 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.58 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

S-Y03 Vanilla drinking yogurt

Status: Harmonized source formulation — production trial required

Source: S163; lines 4280-4335.

Ten bottles, theoretical 216.58 g each. Bottle capacity needs headspace and measured density.

Stage: Cold-line phase • Fit class 3 • Pilot 10 units • Production example ×10 = 100 units.

Technical lineage: S163, this recipe section; source citations in the earlier handbook are historical references, not additional validation.

Formula — Yogurt base

Percent basis: this component input = 100% (not whole assembled product).

Ingredient / specification	Pilot g	Percent	Production g
Whole milk 3.5%	2,060	93.213%	20,600
Yogourmet Original 3g sachet	6	0.271%	60
Sugar	140	6.335%	1,400
Vanilla	4	0.181%	40
TOTAL	2,210	100.000%	22,100

Mass route, pilot: 2,210 g input − 44.2 g handling/unretained (2%) − 0 g process loss (0% of post-handling mass) = 2,165.8 g retained. Allocation: 216.58 g finished component per unit. Production retained mass: 21,658 g. All losses are unmeasured planning allowances.

Batch yield and portion control

Total ingredient input 2,210 g; modeled losses 44.2 g; net edible output 2,165.8 g = 10 × 216.58 g expected finished units, with no modeled remainder. Production example: 22,100 g input → 21,658 g output across 100 units. Display rounding is not label-weight verification.

Composition and freezing/fermentation controls

Development composition estimate (combined input before processing): fat 3.26%, milk solids-not-fat 8.39%, total solids 18.26%, unfermented lactose 4.47%; added sucrose 6.33% and anhydrous dextrose 0.00%. These are formulation estimates, not nutrition analysis or a legal identity certificate.

Lactose is the pre-fermentation estimate; acidification changes sugars/acids. These pilot formulas intentionally use no added stabilizer. Culture performance, pH curve and separation are checked, not assumed from a yogurt name.

Numbered production method

1. Prepare the listed milk, sugar and vanilla using C04 heat treatment; the base deliberately omits added milk powder to reduce body, not milk safety controls.

2. Cool to 42–44°C and add two current 3 g Original sachets per 2 L milk basis. Confirm this sweetened use with supplier; do not split industrial culture sachets without dosing instructions.

3. Incubate in a covered sanitary vessel; track pH and temperature. Stop at pH 4.5 with prompt cooling, then shear gently with the cleaned stick blender in short pulses until pourable.

4. Do not add raw water after fermentation. Fill ten sanitized food bottles by measured net mass and seal with tamper evidence; keep at 4°C or below.

5. Check pourability and separation after 24 and 48 hours, plus pH and laboratory plan. A “shake gently” instruction may address natural separation but cannot excuse microbial gas, spoilage or unsafe storage.

Quality, defects and controlled variants

Too thick → culture/body system or inadequate controlled shear. Sediment/whey → weak stability. Swollen bottle → reject, no tasting; investigate hygiene.

Do not add a random pectin/CMC dose. A stabilized long-distribution version needs a selected acid-dairy stabilizer, supplier process and a new formula.

Allergens, packing, life study and costing

Allergens/ingredients to declare: milk.

Seal in sanitized food-grade cups/bottles with tamper evidence; transport at 4°C or below with logs. No reheating for ordinary yogurt. Study days 0/1/3/7 with a qualified laboratory, not an assigned 7-day sale life. Do not taste gas-producing or suspect samples.

Culture check: the retained 6 g entry assumes two 3 g sachets for 2 L milk. Verify sachet mass and current regional supplier instructions before manufacture; a different culture is not substituted gram for gram.

Normalized formula and labour planning

Weighed ingredient/component	% of listed input
Whole milk 3.5%	93.21
Yogourmet Original 3g sachet	0.27
Sugar	6.33
Vanilla	0.18

Total-formula basis: 2,210.00 g of the listed weighed inputs = 100%. Prepared-component masses are counted once; these percentages do not replace flour-based baker percentages above. Rounding may cause a 0.01-point display difference.

Planning allowance: 20–45 minutes active labour per pilot. Total elapsed time includes the heating, cooling, maturation, culture or freezing stages stated in this card and can extend overnight; enter the actual start-to-release duration on the trial sheet. Do not shorten safety stages to meet this labour estimate.

Harmonization and current cost audit

Retain the specified source formula because its ingredients, process and component routing are more explicit than the earlier drafts. Replace obsolete costs; use Nevada for the named instant yeast at the stated trial dose. Keep true butter, skim powder, whole powder and sweetened condensed milk specifications separate from the owner's stocked substitutes.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole milk 3.5%	2,060.00	UNPRICED	UNPRICED
Yogourmet Original 3g sachet	6.00	UNPRICED	UNPRICED
Sugar	140.00	640.00	89.60
Vanilla	4.00	UNPRICED	UNPRICED

Known ingredient subtotal: **89.60 FCFA per pilot**. Unpriced or unresolved inputs: Vanilla, Whole milk 3.5%, Yogourmet Original 3g sachet. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 8.96 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.90 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Cake doughnuts and additional harmonized trials

T01 Rolled and cut cake doughnuts

Status: Proposed adaptation — trial required

Source: S163 T01 and owner clarification 8 October 2026; named source section / workbook sheet.

Intended product: Rolled and cut cake doughnuts. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Sugar	166.67	833.33	16.67
Roma margarine	168.33	841.67	16.83
Baking powder double acting	13.33	66.67	1.33
Egg edible mass	250.00	1,250.00	25.00
Water	250.00	1,250.00	25.00

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Cream margarine and sugar briefly, add edible egg gradually and mix in water. Sift flour and baking powder; mix just until cohesive. Do not knead like bread.

2. Rest covered 10 minutes. Roll about 10 mm thick as an initial trial, cut rings and weigh 40 g pieces. Rework scraps once; record the quantity.

3. Start frying small loads at 175–180°C; the source proposed 180–185°C, which remains a separate comparison condition. Begin checking after about 2 minutes per side, but establish actual duration from thickness, a set crumb and the house cooked-egg endpoint.

4. Drain and cool. Compare ten pieces for cracking, oiliness, interior set and mass. Only if the control tears from stiffness, run a separate trial at 275 g water; record the extra 25 g and revised yield.

Yield and working time

Input 1,848.33 g; provisional handling loss 2% → 1,811.37 g available. At 40 g raw/component portions: 45 whole units, 11.37 g remainder. Provisional cooking loss 8.00% of portioned mass gives 1,656.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Frying oil is an additional unpriced-quantity process input. Record opening oil + top-ups − reusable closing oil − separately measured discard to estimate food retention; charge discard and filtration losses once to the batch/day. Never add the entire fryer bath to dough mass.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Combine original 1,000 g butter and 10 g EDC as 1,010 g margarine per 6 kg flour, following the owner's clarification. No improver or Milk tantalizer. Exact pilot input is 1,848.333… g; round only at the scale resolution, not by silently changing ratios. Thickness, piece size and frying range are proposed trial settings.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Sugar	166.67	640.00	106.67
Roma margarine	168.33	1,333.33	224.44
Baking powder double acting	13.33	UNPRICED	UNPRICED
Egg edible mass	250.00	UNPRICED	UNPRICED
Water	250.00	UNPRICED	UNPRICED

Known ingredient subtotal: **751.11 FCFA per pilot**. Unpriced or unresolved inputs: Baking powder double acting, Egg edible mass, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 16.69 FCFA for 45 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.67 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H01 Agege style soft loaf

Status: Proposed adaptation — trial required

Source: S163 V01; S003 Agege section; named source section / workbook sheet.

Intended product: Agege style soft loaf. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	570.00	2,850.00	57.00
Sugar	110.00	550.00	11.00
Roma margarine	90.00	450.00	9.00
Salt	18.00	90.00	1.80
Nevada instant dry yeast	12.00	60.00	1.20

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Mix flour, sugar, yeast and 540 g water slowly for 3 minutes. Add salt; develop until elastic. Add margarine in stages and the reserved 30 g water as absorbed. Record actual water if any is withheld.

2. Stop near 26–28°C dough temperature with an extensible film. Bulk ferment covered 45–60 minutes around 26°C, ending at visible expansion; sweetness may lengthen fermentation.

3. Divide at 500 g, rest 10 minutes, mould tightly and place in trial tins. Proof at 28–30°C until the dough is aerated and a light indentation returns slowly, about 50–90 minutes.

4. Trial bake 180–190°C for 28–35 minutes without steam. Check 93–96°C crumb as a quality cue and no gummy base. De-tin and cool fully before packing.

Yield and working time

Input 1,800.00 g; provisional handling loss 2% → 1,764.00 g available. At 500 g raw/component portions: 3 whole units, 264.00 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,320.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 30 minutes; elapsed 3.5–4.5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Select fixed points within the archived ranges; salt set at 1.8% and instant yeast at 1.2%. Improver omitted. This preserves the sweet, close-crumb style without assuming improver-driven keeping quality.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Water	570.00	UNPRICED	UNPRICED
Sugar	110.00	640.00	70.40
Roma margarine	90.00	1,333.33	120.00
Salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **633.90 FCFA per pilot**. Unpriced or unresolved inputs: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 211.30 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 21.13 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H02 Tangzhong milk loaf

Status: Proposed adaptation — trial required

Source: S163 V01; S081 Japanese milk bread; named source section / workbook sheet.

Intended product: Tangzhong milk loaf. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	530.00	2,650.00	53.00
Millac Premium powder	40.00	200.00	4.00
Sugar	100.00	500.00	10.00
Roma margarine	80.00	400.00	8.00
Egg edible mass	100.00	500.00	10.00
Salt	18.00	90.00	1.80
Nevada instant dry yeast	12.00	60.00	1.20

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Take 50 g flour and 250 g water FROM the listed totals. Whisk over gentle heat to a thick paste, about 65°C as a trial starch-gel endpoint. Weigh the paste; restore evaporation with potable water to 300 g. Cool covered promptly to below 30°C for immediate mixing.

2. Mix the remaining 950 g flour, 280 g water, powder, sugar, yeast, egg and all 300 g paste. Add salt, develop partially, then add margarine. Aim for an elastic film at 26–28°C.

3. Bulk ferment 50–70 minutes near 26°C. Divide 500 g, round, rest 15 minutes and mould into tins. Proof 60–90 minutes at 28–30°C to a light resilient crown.

4. Bake 175–185°C for 28–36 minutes, no steam; check set crumb at 93–96°C as a quality cue. Cool, weigh and compare softness at 0 and 24 hours under controlled storage.

Yield and working time

Input 1,880.00 g; provisional handling loss 2% → 1,842.40 g available. At 500 g raw/component portions: 3 whole units, 342.40 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,320.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 40 minutes; elapsed 4–5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Resolve the archived double-counted roux liquid by counting every gram of roux flour and water inside the total. This is a new Millac and Roma adaptation, not an assertion that fat-filled powder equals whole milk.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	530.00	UNPRICED	UNPRICED
Millac Premium powder	40.00	3,200.00	128.00
Sugar	100.00	640.00	64.00
Roma margarine	80.00	1,333.33	106.67
Egg edible mass	100.00	UNPRICED	UNPRICED
Salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00

Known ingredient subtotal: **742.17 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 247.39 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 24.74 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. H03 Open crumb ciabatta

Status: Proposed adaptation — trial required

Source: S081 ciabatta recipe; named source section / workbook sheet.

Intended product: Open crumb ciabatta. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	780.00	3,900.00	78.00
Salt	20.00	100.00	2.00
Nevada instant dry yeast	5.00	25.00	0.50
Neutral food-grade oil	20.00	100.00	2.00

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Mix flour with 740 g water just to combine; rest 20 minutes. Add yeast, salt and remaining 40 g water gradually, then oil. Develop until elastic and extensible; target 24–26°C.

2. Bulk ferment in a covered shallow oiled container about 2–3 hours at 24–26°C. Fold gently at 30 and 60 minutes; finish when well aerated, not collapsed.

3. Tip onto a lightly floured bench, divide gently at 250 g and lift onto trays without tight moulding. Record dusting flour separately. Proof 30–50 minutes until puffy.

4. Trial load at 235°C with approved steam at loading, bake at 220–225°C for 20–25 minutes, vent toward the end. Confirm a set open crumb and dry sidewalls.

Yield and working time

Input 1,825.00 g; provisional handling loss 2% → 1,788.50 g available. At 250 g raw/component portions: 7 whole units, 38.50 g remainder. Provisional cooking loss 16.00% of portioned mass gives 1,470.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 4–5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Retain a distinct high-hydration style. Fix water at 78% for the first flour trial; do not force this dough through the moulder. Small bowls may be more suitable than the large spiral mixer.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	780.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Salt	20.00	194.44	3.89
Nevada instant dry yeast	5.00	1,666.67	8.33
Neutral food-grade oil	20.00	1,413.04	28.26

Known ingredient subtotal: **460.48 FCFA per pilot**. Unpriced or unresolved inputs: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 65.78 FCFA for 7 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 6.58 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H04 Fifty percent whole wheat loaf

Status: Proposed adaptation — trial required

Source: S163 V02 whole wheat loaf; named source section / workbook sheet.

Intended product: Fifty percent whole wheat loaf. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Whole wheat flour	500.00	2,500.00	50.00
Bread flour	500.00	2,500.00	50.00
Water	650.00	3,250.00	65.00
Honey	50.00	250.00	5.00
Neutral food-grade oil	40.00	200.00	4.00
Salt	20.00	100.00	2.00
Nevada instant dry yeast	7.00	35.00	0.70

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Mix both flours and 620 g water; rest 25 minutes for bran hydration. Add honey, yeast, salt, oil and the remaining 30 g water as absorbed.

2. Develop to a moderate elastic film at 25–27°C. Bulk ferment 75–100 minutes with one gentle fold after 40 minutes.

3. Divide 500 g, rest 15 minutes, mould and tin. Proof near 28–30°C for 50–80 minutes, stopping before surface weakness.

4. Bake 190–200°C for 28–36 minutes. De-tin, confirm a set non-sticky centre, cool fully and weigh.

Yield and working time

Input 1,767.00 g; provisional handling loss 2% → 1,731.66 g available. At 500 g raw/component portions: 3 whole units, 231.66 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,320.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 30 minutes; elapsed 4–5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Choose honey explicitly from the archived honey/molasses alternative. No optional seeds are included. Keep this separate from the archived 60% whole-wheat version.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Whole wheat flour	500.00	UNPRICED	UNPRICED
Bread flour	500.00	420.00	210.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Water	650.00	UNPRICED	UNPRICED
Honey	50.00	UNPRICED	UNPRICED
Neutral food-grade oil	40.00	1,413.04	56.52
Salt	20.00	194.44	3.89
Nevada instant dry yeast	7.00	1,666.67	11.67

Known ingredient subtotal: **282.08 FCFA per pilot**. Unpriced or unresolved inputs: Honey, Water, Whole wheat flour. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 94.03 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 9.40 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H05 Danisa style margarine biscuits

Status: Proposed adaptation — trial required

Source: S132 Danisa biscuits C5:D14; S096; named source section / workbook sheet.

Intended product: Danisa style margarine biscuits. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Roma margarine	503.00	2,515.00	50.30
Sugar	278.00	1,390.00	27.80
Millac Premium powder	50.00	250.00	5.00
Egg edible mass	139.00	695.00	13.90
Salt	6.00	30.00	0.60

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Use margarine that is pliable but not oily. Cream margarine and fine granulated sugar on low-medium speed until smooth and slightly light; a paddle or hand mixer is needed.

2. Add weighed egg gradually. Sift flour, powder and salt together; mix in only until no dry streaks remain. Avoid bread-style kneading.

3. Rest covered 15–20 minutes in a cool place. Test pipeability; use a large star nozzle only if the dough flows cleanly. Otherwise shape measured 25 g discs, not extra unrecorded liquid.

4. Arrange about 35–48 trial pieces per 60 × 40 cm tray with room to spread. Bake 165–175°C, initially 14–20 minutes. Cool completely; require an even set centre and crisp bite before sealing.

Yield and working time

Input 1,976.00 g; provisional handling loss 2% → 1,936.48 g available. At 25 g raw/component portions: 77 whole units, 11.48 g remainder. Provisional cooking loss 10.00% of portioned mass gives 1,732.50 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 40 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Scale the current workbook to 1 kg flour; combine its butter and EDC as margarine, omit improver, round production weights to practical grams. Millac substitution is explicit; biscuit flour suitability must be trialled. Do not market as dairy-butter biscuits.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Roma margarine	503.00	1,333.33	670.67
Sugar	278.00	640.00	177.92
Millac Premium powder	50.00	3,200.00	160.00
Egg edible mass	139.00	UNPRICED	UNPRICED
Salt	6.00	194.44	1.17

Known ingredient subtotal: **1,429.75 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 18.57 FCFA for 77 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.86 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H06 Melto short margarine biscuits

Status: Proposed adaptation — trial required

Source: S132 Melto C5:D10; compare Melto1; named source section / workbook sheet.

Intended product: Melto short margarine biscuits. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Roma margarine	445.00	2,225.00	44.50
Sugar	90.00	450.00	9.00
Icing sugar	90.00	450.00	9.00
Egg edible mass	35.00	175.00	3.50
Salt	6.00	30.00	0.60

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Cream margarine with both sugars just until smooth. Add edible egg and salt; mix evenly.

2. Fold in flour with minimal mixing. Compress gently; chill covered 20–30 minutes if too soft to cut.

3. Roll to 7–8 mm between sheets; cut and weigh 25 g pieces. Re-roll scraps once. Arrange with at least 2 cm expansion clearance.

4. Trial bake 165–175°C for 15–20 minutes until edges are pale golden and centre is set. Cool fully before a crunch and package-condensation check.

Yield and working time

Input 1,666.00 g; provisional handling loss 2% → 1,632.68 g available. At 25 g raw/component portions: 65 whole units, 7.68 g remainder. Provisional cooking loss 9.00% of portioned mass gives 1,478.75 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Keep Melto and Melto1 source ratios separately in the legacy register. This trial follows Melto, combines practical rounded quantities and reduces salt from about 8.9 to 6 g/kg flour for a less salty biscuit.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Roma margarine	445.00	1,333.33	593.33
Sugar	90.00	640.00	57.60

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Icing sugar	90.00	UNPRICED	UNPRICED
Egg edible mass	35.00	UNPRICED	UNPRICED
Salt	6.00	194.44	1.17

Known ingredient subtotal: **1,072.10 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass, Icing sugar. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 16.49 FCFA for 65 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.65 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Repeat independently before scale-up.

H07 Milk shortbread biscuits

Status: Proposed adaptation — trial required

Source: S132 Short bread C5:D12; named source section / workbook sheet.

Intended product: Milk shortbread biscuits. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Roma margarine	500.00	2,500.00	50.00
Sugar	200.00	1,000.00	20.00
Icing sugar	50.00	250.00	5.00
Egg edible mass	50.00	250.00	5.00
Millac Premium powder	20.00	100.00	2.00
Water	50.00	250.00	5.00
Salt	6.00	30.00	0.60

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Blend margarine and sugars until smooth. Mix powder with the listed water, then add with egg to the fat mixture.

2. Add flour and salt; mix just to a cohesive short dough. Rest chilled 20–30 minutes.

3. Roll 8 mm thick, cut 30 g pieces and dock lightly. Keep thickness consistent; do not add bench flour without weighing it.

4. Trial bake 160–170°C for 18–24 minutes until set through and lightly coloured. Cool fully and assess friability and grease marks before packing.

Yield and working time

Input 1,876.00 g; provisional handling loss 2% → 1,838.48 g available. At 30 g raw/component portions: 61 whole units, 8.48 g remainder. Provisional cooking loss 10.00% of portioned mass gives 1,647.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

The original salt is 150 g per 2 kg flour, an implausible 7.5%. Reduce to 0.6%; replace ambiguous milk with a specified powder-and-water trial. These are deliberate recipe changes requiring tasting.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA

Egg edible mass	50.00	UNPRICED	UNPRICED
Millac Premium powder	20.00	3,200.00	64.00
Water	50.00	UNPRICED	UNPRICED
Salt	6.00	194.44	1.17

Known ingredient subtotal: **1,279.83 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass, Icing sugar, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 20.98 FCFA for 61 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.10 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H08 Marble pound cake

Status: Proposed adaptation — trial required

Source: S163 V02 pound cake; S132 cake marbre; named source section / workbook sheet.

Intended product: Marble pound cake. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	500.00	2,500.00	100.00
Sugar	500.00	2,500.00	100.00
Roma margarine	500.00	2,500.00	100.00
Egg edible mass	500.00	2,500.00	100.00
Baking powder double acting	8.00	40.00	1.60
Salt	3.00	15.00	0.60
Vanilla extract	3.00	15.00	0.60
Unsweetened cocoa	25.00	125.00	5.00
Water	25.00	125.00	5.00

Percentage basis: 500.00 g total flour = 100% (including roux flour).

Numbered method

1. Grease and line trial tins. Cream margarine and sugar until lighter; add room-temperature edible egg in small additions, scraping the bowl.

2. Sift flour, baking powder and salt, fold gently into the emulsion with vanilla. A paddle mixer is required; the spiral mixer is not a cake mixer.

3. Remove one third of the plain batter. Mix cocoa and water into a paste, fold into that third, then alternate light and dark batter in tins and swirl twice. Deposit 500 g per trial tin with room to rise.

4. Trial bake 165–175°C for 35–50 minutes; time depends on tin geometry. The centre must be set and a skewer free of wet batter. Cool safely on racks before wrapping and cutting.

Yield and working time

Input 2,064.00 g; provisional handling loss 2% → 2,022.72 g available. At 500 g raw/component portions: 4 whole units, 22.72 g remainder. Provisional cooking loss 10.00% of portioned mass gives 1,800.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 2–3 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Select a coherent equal-weight pound-cake base from V02 instead of averaging the highly diluted workbook marble formula. Cocoa and its water are explicit additions. Local flour strength and tin depth require tests.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	500.00	420.00	210.00
Sugar	500.00	640.00	320.00
Roma margarine	500.00	1,333.33	666.67
Egg edible mass	500.00	UNPRICED	UNPRICED
Baking powder double acting	8.00	UNPRICED	UNPRICED
Salt	3.00	194.44	0.58
Vanilla extract	3.00	UNPRICED	UNPRICED
Unsweetened cocoa	25.00	UNPRICED	UNPRICED
Water	25.00	UNPRICED	UNPRICED

Known ingredient subtotal: **1,197.25 FCFA per pilot**. Unpriced or unresolved inputs: Baking powder double acting, Egg edible mass, Unsweetened cocoa, Vanilla extract, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 299.31 FCFA for 4 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 29.93 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H09 Plain genoise sponge

Status: Proposed adaptation — trial required

Source: S046 GENOISE; S132 cake family; named source section / workbook sheet.

Intended product: Plain genoise sponge. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	500.00	2,500.00	100.00
Egg edible mass	850.00	4,250.00	170.00
Sugar	500.00	2,500.00	100.00
Vanilla extract	4.00	20.00	0.80

Percentage basis: 500.00 g total flour = 100% (including roux flour).

Numbered method

1. Prepare shallow lined tins. Combine eggs and sugar; warm over a gentle water bath to about 38–40°C while stirring, then whisk to a thick pale ribbon.

2. Sift flour. Fold it into the foam in three additions with vanilla, keeping as much air as possible. No chemical leavener is added.

3. Deposit immediately at 400 g per shallow trial tin; do not hold batter. Start at 170–180°C for 20–30 minutes, adjusting to measured depth.

4. Require a resilient centre with no wet streaks. Cool protected; use plain the same day or route to an approved chilled filled-cake process.

Yield and working time

Input 1,854.00 g; provisional handling loss 2% → 1,816.92 g available. At 400 g raw/component portions: 4 whole units, 216.92 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,408.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 30 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Preserve the flour/egg/sugar ratio of the GENOISE sheet. Omit its 45 g nutmeg per kg flour and specify a small vanilla dose instead; this changes flavour, not the sponge structure.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	500.00	420.00	210.00
Egg edible mass	850.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Vanilla extract	4.00	UNPRICED	UNPRICED

Known ingredient subtotal: **530.00 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass, Vanilla extract. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 132.50 FCFA for 4 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 13.25 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H10 Crisp chin chin

Status: Proposed adaptation — trial required

Source: S132 Best Chinchin and Chinchin; S163 V04/V05; named source section / workbook sheet.

Intended product: Crisp chin chin. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Sugar	180.00	900.00	18.00
Roma margarine	160.00	800.00	16.00
Egg edible mass	300.00	1,500.00	30.00
Water	100.00	500.00	10.00
Millac Premium powder	40.00	200.00	4.00
Salt	8.00	40.00	0.80
Baking powder double acting	20.00	100.00	2.00
Ground nutmeg	2.00	10.00	0.20

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Rub margarine into flour, baking powder, powder milk, salt and nutmeg. Dissolve sugar in water, add eggs, then combine just until a firm dough forms. Do not knead to a bread window.

2. Rest covered 15 minutes. Roll uniformly 4–5 mm thick and cut small strips or cubes. The 20 g costing portion is a packaged portion, not one raw cube.

3. Fry a small measured load in approved oil at a trial 165–175°C. Stir gently for even colouring; establish time from uniform thickness and a crisp cooled centre.

4. Drain on a rack, cool fully and weigh cooked yield and retained oil. Pack dry. No three-month life is claimed; establish water activity and packaging performance before extended storage.

Yield and working time

Input 1,810.00 g; provisional handling loss 2% → 1,773.80 g available. At 20 g raw/component portions: 88 whole units, 13.80 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,548.80 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 50 minutes; elapsed 1.5–2.5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Frying oil is an additional unpriced-quantity process input. Record opening oil + top-ups − reusable closing oil − separately measured discard to estimate food retention; charge discard and filtration losses once to the batch/day. Never add the entire fryer bath to dough mass.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Separate oil in the dough from fryer charge. Use an explicit small-batch formula within the richer historical range; remove unidentified additives. Frying loss and absorption must be measured separately.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Sugar	180.00	640.00	115.20
Roma margarine	160.00	1,333.33	213.33
Egg edible mass	300.00	UNPRICED	UNPRICED
Water	100.00	UNPRICED	UNPRICED
Millac Premium powder	40.00	3,200.00	128.00
Salt	8.00	194.44	1.56
Baking powder double acting	20.00	UNPRICED	UNPRICED
Ground nutmeg	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **878.09 FCFA per pilot**. Unpriced or unresolved inputs: Baking powder double acting, Egg edible mass, Ground nutmeg, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 9.98 FCFA for 88 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.00 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H11 Cake style beignets souffles

Status: Proposed adaptation — trial required

Source: S133 body ingredient list; S132 Beignet soufle; named source section / workbook sheet.

Intended product: Cake style beignets souffles. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Sugar	300.00	1,500.00	30.00
Roma margarine	200.00	1,000.00	20.00
Egg edible mass	500.00	2,500.00	50.00
Pasteurized whole milk	300.00	1,500.00	30.00
Baking powder double acting	16.00	80.00	1.60
Salt	12.00	60.00	1.20
Vanilla sugar	20.00	100.00	2.00
Fresh lime zest	4.00	20.00	0.40

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Cream margarine and sugars until evenly blended. Add eggs gradually, then milk. Sift flour, baking powder and salt and fold in with finely grated washed lime zest.

2. Mix just until uniform; rest 10 minutes covered. The base is chemically leavened, so do not give it a yeast proof.

3. Portion 35 g consistently with a scoop. Fry small loads at a starting 170–175°C; turn to colour evenly. Trial approximately 4–6 minutes, then confirm a fully set centre and the house cooked-egg endpoint.

4. Drain, cool briefly and serve fresh. Weigh oil uptake and cooled pieces; do not pack while steaming.

Yield and working time

Input 2,352.00 g; provisional handling loss 2% → 2,304.96 g available. At 35 g raw/component portions: 65 whole units, 29.96 g remainder. Provisional cooking loss 7.00% of portioned mass gives 2,115.75 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 1–1.5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Frying oil is an additional unpriced-quantity process input. Record opening oil + top-ups − reusable closing oil − separately measured discard to estimate food retention; charge discard and filtration losses once to the batch/day. Never add the entire fryer bath to dough mass.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Interpret the source's "1 50g sugar" as 150 g per 500 g flour and flag it for checking. Five eggs are replaced by 250 g edible egg at that source scale; this is an explicit trial assumption. The litre of oil is a fryer charge, not batter mass.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Sugar	300.00	640.00	192.00
Roma margarine	200.00	1,333.33	266.67
Egg edible mass	500.00	UNPRICED	UNPRICED
Pasteurized whole milk	300.00	UNPRICED	UNPRICED
Baking powder double acting	16.00	UNPRICED	UNPRICED
Salt	12.00	194.44	2.33
Vanilla sugar	20.00	UNPRICED	UNPRICED
Fresh lime zest	4.00	UNPRICED	UNPRICED

Known ingredient subtotal: **881.00 FCFA per pilot**. Unpriced or unresolved inputs: Baking powder double acting, Egg edible mass, Fresh lime zest, Pasteurized whole milk, Vanilla sugar. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 13.55 FCFA for 65 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 1.36 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

H12 Laminated croissants

Status: Proposed adaptation — trial required — equipment hold

Source: S163 V02; S132 Croissant and Croissant new; named source section / workbook sheet.

Intended product: Laminated croissants. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	550.00	2,750.00	55.00
Sugar	100.00	500.00	10.00
Roma margarine	40.00	200.00	4.00
Salt	20.00	100.00	2.00
Nevada instant dry yeast	15.00	75.00	1.50
Qualified roll-in pastry fat	250.00	1,250.00	25.00

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Mix flour, water, sugar, salt, yeast and 40 g Roma into a moderately developed dough, about 4 minutes low and 2–3 minutes faster as an initial trial. Target 22–24°C; flatten and chill promptly.

2. Use the 250 g roll-in fat as a separate sheet with the same workable firmness as the cold dough. Enclose it fully. Give three single folds, chilling 20–30 minutes between folds or until firm enough to roll without fat smearing.

3. Rest chilled 45–60 minutes, roll to 3.5–4 mm and cut triangles; weigh 80 g pieces. Shape with light tension. Proof at 25–27°C until visibly layered and wobbly, approximately 2–3 hours; excessive heat melts the layers.

4. Bake unwashed baseline pieces at a trial 190–200°C for 18–24 minutes, no steam. Check set honeycomb crumb and no raw compressed line. Record trim and rework separately.

Yield and working time

Input 1,975.00 g; provisional handling loss 2% → 1,935.50 g available. At 80 g raw/component portions: 24 whole units, 15.50 g remainder. Provisional cooking loss 13.00% of portioned mass gives 1,670.40 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 70 minutes; elapsed 6–8 h including chilling. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Choose a clearly separated 25% roll-in-fat formula. Roma bucket margarine is NOT assumed suitable for laminating. Hold this card until fat specification, chilled workspace and suitable rolling equipment are confirmed.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Water	550.00	UNPRICED	UNPRICED
Sugar	100.00	640.00	64.00
Roma margarine	40.00	1,333.33	53.33
Salt	20.00	194.44	3.89
Nevada instant dry yeast	15.00	1,666.67	25.00
Qualified roll-in pastry fat	250.00	UNPRICED	UNPRICED

Known ingredient subtotal: **566.22 FCFA per pilot**. Unpriced or unresolved inputs: Qualified roll-in pastry fat, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 23.59 FCFA for 24 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 2.36 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H13 Chocolate laminated rolls

Status: Proposed adaptation — trial required — equipment hold

Source: H12; S163 V02 pain au chocolat; named source section / workbook sheet.

Intended product: Chocolate laminated rolls. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
H12 Laminated croissant dough	1,000.00	5,000.00	89.29
Bake stable chocolate batons	120.00	600.00	10.71

Percentage basis: 1,120.00 g total formula = 100%.

Numbered method

1. Prepare H12 through its final chilled rest. Weigh 1,000 g usable laminated dough; allow for trim in the component's usable yield.

2. Roll 4 mm thick and divide into ten 100 g rectangles. Place 12 g chocolate on each rectangle and roll with the seam beneath. Chocolate weight includes all batons used.

3. Proof at 25–27°C until layers separate and the pieces wobble slightly. Bake 190–200°C, initially 18–24 minutes, to a set interior.

4. Cool fully; compare chocolate distribution and underbaked seams. Wrap for same-day sale.

Yield and working time

Input 1,120.00 g; provisional handling loss 2% → 1,097.60 g available. At 112 g raw/component portions: 9 whole units, 89.60 g remainder. Provisional cooking loss 13.00% of portioned mass gives 876.96 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 20 minutes; elapsed 2.5–4 h after dough preparation. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Make the archived 10–12 g chocolate range exact at 12 g and define 100 g dough per piece. This assembly does not introduce a second dough formula.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
H12 Laminated croissant dough	1,000.00	292.55	292.55
Bake stable chocolate batons	120.00	UNPRICED	UNPRICED

Known ingredient subtotal: **292.55 FCFA per pilot**. Unpriced or unresolved inputs: Bake stable chocolate batons, H12: Qualified roll-in pastry fat, H12: Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 32.51 FCFA for 9 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.25 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H14 Local chocolate galette bread

Status: Proposed adaptation — trial required

Source: S144 Galette Recipe; S132 Galette; named source section / workbook sheet.

Intended product: Local chocolate galette bread. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Sugar	120.00	600.00	12.00
Roma margarine	120.00	600.00	12.00
Salt	14.00	70.00	1.40
Baking powder double acting	10.00	50.00	1.00
Nevada instant dry yeast	10.00	50.00	1.00
Egg edible mass	100.00	500.00	10.00
Water	450.00	2,250.00	45.00
Bake stable chocolate	60.00	300.00	6.00

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Blend flour and baking powder. Mix with sugar, yeast, water and eggs, then salt. Develop partially, add margarine and finish to a moderate elastic film at 25–27°C.

2. Fold chopped chocolate through at low speed. Rest covered 30–45 minutes; divide 100 g and form low round buns.

3. Proof around 28°C to visible aeration and slow spring-back, initially 45–75 minutes. Do not judge by clock alone because this is a dual-leavened test.

4. Bake 175–185°C for about 16–22 minutes. Cool and compare volume, tearing and eating quality with the existing product.

Yield and working time

Input 1,884.00 g; provisional handling loss 2% → 1,846.32 g available. At 100 g raw/component portions: 18 whole units, 46.32 g remainder. Provisional cooking loss 11.00% of portioned mass gives 1,602.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 35 minutes; elapsed 3–4 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Retain the local galette name but identify this as a sweet bread, not French galette des rois. Increase source water from 30% to 45% and reduce both leaveners to 1% for a controlled first trial; original ratios remain archived.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Sugar	120.00	640.00	76.80
Roma margarine	120.00	1,333.33	160.00
Salt	14.00	194.44	2.72
Baking powder double acting	10.00	UNPRICED	UNPRICED
Nevada instant dry yeast	10.00	1,666.67	16.67
Egg edible mass	100.00	UNPRICED	UNPRICED
Water	450.00	UNPRICED	UNPRICED
Bake stable chocolate	60.00	UNPRICED	UNPRICED

Known ingredient subtotal: **676.19 FCFA per pilot**. Unpriced or unresolved inputs: Bake stable chocolate, Baking powder double acting, Egg edible mass, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 37.57 FCFA for 18 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 3.76 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H15 Zebra chocolate milk loaf

Status: Proposed adaptation — trial required

Source: S132 Zebree; B04 sweet milk buns; named source section / workbook sheet.

Intended product: Zebra chocolate milk loaf. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	610.00	3,050.00	61.00
Millac Premium powder	40.00	200.00	4.00
Egg edible mass	100.00	500.00	10.00
Roma margarine	100.00	500.00	10.00
Sugar	100.00	500.00	10.00
Salt	18.00	90.00	1.80
Nevada instant dry yeast	12.00	60.00	1.20
Unsweetened cocoa	50.00	250.00	5.00

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Make an enriched dough from all ingredients EXCEPT cocoa and 60 g of the water. Develop at 25–27°C and divide the raw dough into 70% plain and 30% coloured portions by weight.

2. Mix cocoa with the reserved 60 g water, then incorporate into the smaller portion with minimal additional mixing. Bulk ferment both doughs covered 45–70 minutes.

3. For each loaf allocate the same plain-to-chocolate ratio from the completed dough totals. Layer strips, roll gently and weigh 500 g per tin. Record any leftovers.

4. Proof at 28–30°C until evenly aerated, initially 60–90 minutes. Bake 175–185°C for 28–36 minutes to a fully set centre. Cut only after complete cooling.

Yield and working time

Input 2,030.00 g; provisional handling loss 2% → 1,989.40 g available. At 500 g raw/component portions: 3 whole units, 489.40 g remainder. Provisional cooking loss 12.00% of portioned mass gives 1,320.00 g before any frying-oil uptake. Do not apply both this illustration and a second loss allowance to the same batch.

Active pilot labour about 45 minutes; elapsed 4–5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Modernized visual variant; original Zebree chocolate type and swirl method are unspecified. Define cocoa, its added water and the split sequence. This is a proposed reformulation, not an exact reproduction.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00
Water	610.00	UNPRICED	UNPRICED
Millac Premium powder	40.00	3,200.00	128.00
Egg edible mass	100.00	UNPRICED	UNPRICED
Roma margarine	100.00	1,333.33	133.33
Sugar	100.00	640.00	64.00
Salt	18.00	194.44	3.50
Nevada instant dry yeast	12.00	1,666.67	20.00
Unsweetened cocoa	50.00	UNPRICED	UNPRICED

Known ingredient subtotal: **768.83 FCFA per pilot**. Unpriced or unresolved inputs: Egg edible mass, Unsweetened cocoa, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 256.28 FCFA for 3 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 25.63 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified; Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H16 Rosemary tray focaccia

Status: Proposed adaptation — trial required

Source: S163 V03 focaccia development gap; named source section / workbook sheet.

Intended product: Rosemary tray focaccia. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Bread flour	1,000.00	5,000.00	100.00
Water	750.00	3,750.00	75.00
Neutral food-grade oil	80.00	400.00	8.00
Salt	20.00	100.00	2.00
Nevada instant dry yeast	7.00	35.00	0.70
Dried rosemary	2.00	10.00	0.20

Percentage basis: 1,000.00 g total flour = 100% (including roux flour).

Numbered method

1. Reserve 30 g water and 20 g oil for the surface. Mix flour, remaining 720 g water, yeast and salt until elastic, then incorporate 40 g oil. Keep the final 20 g oil for greasing the tray.

2. Bulk ferment covered 90–120 minutes near 25°C with folds at 30 and 60 minutes. Transfer to the measured 60 × 40 cm greased tray and ease outward without tearing.

3. Rest 20 minutes, finish stretching and proof 40–60 minutes. Dimple with wet fingers and distribute reserved water, oil and rosemary evenly.

4. Bake 215–225°C for about 20–28 minutes to a set, open crumb and golden top. Weigh the slab cooled and cut measured 150 g finished portions; include trim in saleable yield.

Yield and working time

Finished-mass costing trial: input 1,859.00 g; provisional process loss 13.00% → 1,617.33 g before any frying-oil pickup; at 150 g finished portions this gives 10 units and 117.33 g remainder. For chips, this estimate is incomplete until oil pickup is measured.

Active pilot labour about 30 minutes; elapsed 3.5–4.5 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

New development using the existing flour, yeast and oil range. It fills an explicit menu gap and provides a savoury shared-tray product without a chilled topping.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Bread flour	1,000.00	420.00	420.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Water	750.00	UNPRICED	UNPRICED
Neutral food-grade oil	80.00	1,413.04	113.04
Salt	20.00	194.44	3.89
Nevada instant dry yeast	7.00	1,666.67	11.67
Dried rosemary	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **548.60 FCFA per pilot**. Unpriced or unresolved inputs: Dried rosemary, Water. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 54.86 FCFA for 10 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 5.49 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Wheat/gluten unless a verified gluten-free ingredient is specified Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H17 Thin plantain chips

Status: Proposed adaptation — trial required

Source: S059 plantain chips guide; named source section / workbook sheet.

Intended product: Thin plantain chips. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Peeled firm unripe plantain	1,000.00	5,000.00	99.40
Salt	6.00	30.00	0.60

Percentage basis: 1,006.00 g total formula = 100%.

Numbered method

1. Wash the whole plantain, peel hygienically and weigh 1,000 g edible raw material. Slice evenly at a trial 1.5–2 mm. Keep slices dry before frying.

2. Fry small separated batches at a starting 165–175°C using oil suitable for deep frying. Measure temperature recovery; cook until bubbles subside and a cooled sample is crisp throughout.

3. Drain well, season with the measured salt, cool fully and weigh. Record frying oil added, recovered, discarded and retained; the oil bath is not part of the 1,006 g raw input.

4. Pack 50 g finished portions only after a crispness and condensation check. Establish packaging and storage life through trials; do not inherit a multi-month life claim.

Yield and working time

Finished-mass costing trial: input 1,006.00 g; provisional process loss 55.00% → 452.70 g before any frying-oil pickup; at 50 g finished portions this gives 9 units and 2.70 g remainder. For chips, this estimate is incomplete until oil pickup is measured.

Active pilot labour about 35 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Frying oil is an additional unpriced-quantity process input. Record opening oil + top-ups − reusable closing oil − separately measured discard to estimate food retention; charge discard and filtration losses once to the batch/day. Never add the entire fryer bath to dough mass.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Retain a locally relevant snack from the discovered guide. The 55% raw-to-fried mass loss is only a costing trial allowance before separately measured oil uptake.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Peeled firm unripe plantain	1,000.00	UNPRICED	UNPRICED
Salt	6.00	194.44	1.17

Known ingredient subtotal: **1.17 FCFA per pilot**. Unpriced or unresolved inputs: Peeled firm unripe plantain. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 0.13 FCFA for 9 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.01 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Check all ingredient labels and prepared-component allergens; no allergen-free claim. Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Trial record for this card: date/lot ____; ingredient specifications ____; batch input ____ g; water actually used ____ g; start/end times ____; active labour ____ min; critical temperatures/pH ____; cooled usable mass ____ g; saleable units ____; rejects/leftovers ____ g; measured energy/oil ____; sensory result ____; complete cost ____ FCFA; approved version and reviewer ____. Repeat independently before scale-up.

H18 Caramelized onion and cheese filling

Status: Proposed adaptation — trial required

Source: S050 PDF page 2 OCR visually checked; named source section / workbook sheet.

Intended product: Caramelized onion and cheese filling. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Peeled onions	1,000.00	5,000.00	79.55
Neutral food-grade oil	40.00	200.00	3.18
Balsamic vinegar	10.00	50.00	0.80
Gruyere cheese	200.00	1,000.00	15.91
Salt	6.00	30.00	0.48
Black pepper	1.00	5.00	0.08

Percentage basis: 1,257.00 g total formula = 100%.

Numbered method

1. Slice onions evenly. Cook gently in the oil, stirring, until soft, reduced and golden; initially allow 30–40 minutes. Add vinegar, salt and pepper near the end.

2. Probe the cooked batch and use the house cooked-food endpoint. Spread in shallow sanitized pans and actively cool within the cooling limits.

3. When at 4°C or below, fold in grated ready-to-eat cheese. Weigh the final chilled filling and keep covered at 4°C or below.

4. Use 40 g per filled bun trial; specify the bun dough separately. Validate the baking and filling core temperature before selling; plain-bread ambient handling does not apply.

Yield and working time

Input 1,257.00 g; illustrative cooking/transfer loss 28.00%, target usable 905.04 g. Weigh chilled output; at 40 g filling per product, divide actual usable mass by 40 and round down. Cost dough and other assembly components separately.

Active pilot labour about 25 minutes; elapsed 1.5–3 h including validated cooling. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Convert vague onions and spoon measures to explicit proposed masses, preserving the caramelized onion and Gruyere character. Chilled storage and controlled cooling added.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Peeled onions	1,000.00	UNPRICED	UNPRICED
Neutral food-grade oil	40.00	1,413.04	56.52
Balsamic vinegar	10.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Gruyere cheese	200.00	UNPRICED	UNPRICED
Salt	6.00	194.44	1.17
Black pepper	1.00	UNPRICED	UNPRICED

Known ingredient subtotal: **57.69 FCFA per pilot**. Unpriced or unresolved inputs: Balsamic vinegar, Black pepper, Gruyere cheese, Peeled onions. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Repeat independently before scale-up.

H19 Vanilla pastry cream

Status: Proposed adaptation — trial required

Source: S050 PDF page 3 OCR visually checked; named source section / workbook sheet.

Intended product: Vanilla pastry cream. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Pasteurized whole milk	500.00	2,500.00	64.77
Sugar	100.00	500.00	12.95
Pasteurized egg yolk	80.00	400.00	10.36
Cornstarch	40.00	200.00	5.18
Unsalted dairy butter	50.00	250.00	6.48
Vanilla extract	2.00	10.00	0.26

Percentage basis: 772.00 g total formula = 100%.

Numbered method

1. Mix cornstarch with 100 g of the listed cold milk. Whisk in sugar and yolk. Heat the remaining 400 g milk with vanilla in a clean heavy pan.

2. Temper the yolk mixture with hot milk, return everything to the pan and whisk continuously to a full bubbling boil. Hold a gentle boil for about 1 minute while stirring, then verify the cooked-egg endpoint and no starch taste.

3. Remove from heat, incorporate butter, spread in shallow sanitized pans and apply protected rapid cooling. Log the two cooling stages; store at 4°C or below.

4. Pipe 30 g per trial pastry only with sanitized equipment and an approved filled-product process. Do not hold cream-filled buns warm on the plain-bread shelf.

Yield and working time

Input 772.00 g; illustrative cooking/transfer loss 3.00%, target usable 748.84 g. Weigh chilled output; at 30 g filling per product, divide actual usable mass by 30 and round down. Cost dough and other assembly components separately.

Active pilot labour about 20 minutes; elapsed 1–3 h including validated cooling. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

Replace four yolks by a specified 80 g pasteurized yolk mass and the vanilla bean by 2 g extract. Preserve real dairy butter as a separate professional formula; it is not the workbook margarine alias.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Pasteurized whole milk	500.00	UNPRICED	UNPRICED
Sugar	100.00	640.00	64.00

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Pasteurized egg yolk	80.00	UNPRICED	UNPRICED
Cornstarch	40.00	UNPRICED	UNPRICED
Unsalted dairy butter	50.00	UNPRICED	UNPRICED
Vanilla extract	2.00	UNPRICED	UNPRICED

Known ingredient subtotal: **64.00 FCFA per pilot**. Unpriced or unresolved inputs: Cornstarch, Pasteurized egg yolk, Pasteurized whole milk, Unsalted dairy butter, Vanilla extract. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Allergen review: Milk; check margarine and compound ingredients; Egg; verify mayonnaise specification Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

H20 Honey oat and groundnut granola

Status: Proposed adaptation — trial required

Source: S179 PDF pages 21–22; new fixed-mass adaptation; named source section / workbook sheet.

Intended product: Honey oat and groundnut granola. Version H1; all quantities below are grams. Commercial example is ×5, subject to equipment and process trials.

Ingredient	Pilot g	Commercial g	% basis
Rolled oats	500.00	2,500.00	58.41
Ready-to-eat roasted groundnuts	150.00	750.00	17.52
Honey	100.00	500.00	11.68
Sugar	50.00	250.00	5.84
Neutral food-grade oil	50.00	250.00	5.84
Salt	3.00	15.00	0.35
Ground cinnamon	3.00	15.00	0.35

Percentage basis: 856.00 g total formula = 100%.

Numbered method

1. Use inspected ready-to-eat groundnuts from a supplier with aflatoxin controls; discard mouldy or damaged material. Mix oats, nuts, cinnamon and salt.

2. Warm honey only enough to flow, mix with sugar and oil, then coat the dry ingredients uniformly.

3. Spread thinly on a lined tray. Trial bake 145–155°C for 25–35 minutes, stirring every 8–10 minutes, until dry and evenly golden without scorched nuts.

4. Cool completely before breaking into clusters and portioning at 30 g finished mass. Add to yogurt only at service; keep the dry and chilled components separate.

Yield and working time

Finished-mass costing trial: input 856.00 g; provisional process loss 6.00% → 804.64 g before any frying-oil pickup; at 30 g finished portions this gives 26 units and 24.64 g remainder. For chips, this estimate is incomplete until oil pickup is measured.

Active pilot labour about 20 minutes; elapsed 1.5–2 h. These are planning estimates; log actual labour separately from oven, proofing, chilling and freezing time.

Equipment: calibrated scales and probe; 60 × 40 cm trays where applicable. Confirm tin/mould dimensions. Use a paddle/whisk for cakes and biscuits, an appropriate dough mixer for bread and a thermostatically controlled fryer for fried products. Times do not scale with ingredient weights.

Quality: weigh at least ten pieces; check uniform size, fully set centre, appropriate softness/crispness and no raw flour, burnt flavour or excess grease. Dense bread: check dough temperature/proof before adding yeast. Tough biscuits/cake: reduce mixing after flour. Dark exterior with a wet centre: reduce heat and/or thickness in a new measured trial.

Harmonization and current cost audit

A small complementary dry topping from the yogurt collection, with every ingredient weighed. Any longer life needs water-activity and packaging evidence. No health or high-protein claim is made.

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Rolled oats	500.00	UNPRICED	UNPRICED
Ready-to-eat roasted groundnuts	150.00	UNPRICED	UNPRICED

Ingredient or component	Pilot g	FCFA/kg	Extended FCFA
Honey	100.00	UNPRICED	UNPRICED
Sugar	50.00	640.00	32.00
Neutral food-grade oil	50.00	1,413.04	70.65
Salt	3.00	194.44	0.58
Ground cinnamon	3.00	UNPRICED	UNPRICED

Known ingredient subtotal: **103.24 FCFA per pilot**. Unpriced or unresolved inputs: Ground cinnamon, Honey, Ready-to-eat roasted groundnuts, Rolled oats. Water, process aids, frying-oil quantity where applicable, packaging, energy, labour, transport and losses outside the stated model must be completed before a full variable cost or contribution is reported.

Illustrative known-ingredient subtotal per planned unit: 3.97 FCFA for 26 units. This is not complete unit cost. A 10% increase in all currently priced inputs adds 0.40 FCFA per planned unit; 10% fewer saleable units raises the same batch-cost allocation by 11.11% before whole-unit rounding.

Allergen review: Groundnut/peanut Include the labels of every prepared component.

Site and packing: prepare centrally at A; transfer with lot, time and temperature records. Plain unfilled bread/biscuits require protected cooling and dry food-grade packaging. Meat, egg, dairy, wet fillings and sauces follow C01–C04 with validated cooling and chilled transport. Retail B performs only the specified finishing/assembly. Keep frozen products continuously frozen; never display cooked meat on an unheated shawarma spit. Storage duration requires a product-specific release decision; no inherited shelf-life guarantee applies.

Honey oat and groundnut granola	H20

Name	Recipe ID
Kumba-style soft block loaf	S-B02
Laminated croissants	H12
Lemon fish wrap — ten-unit pilot	O-A03
Lemon-garlic fish burger — ten-unit pilot	O-A02
lemon-garlic oven fish	O-B36
Loaded chicken shawarma fries	O-P19
Local chocolate galette bread	H14
Mango yogurt frozen bar	O-F07
Mango yogurt popsicle mix	O-FBASE4
Marble pound cake	H08
Melto short margarine biscuits	H06
Milk bread finger rolls / pain au lait	S-B07
Milk cake sponge: batter to baked component	O-B32
Milk shortbread biscuits	H07
Mini chicken pizzas	S-F06
Nkambe sweet potato milk loaf	O-P03
Open crumb ciabatta	H03
Own-brand premium chocolate-coated ice-cream bar	S-I04
Pain omelette with sardines	S-F02
Personal chicken pizza	O-P12
Pineapple fruit ice mix	O-FBASE3
Pineapple fruit ice pops	O-F06
Pineapple-ginger fruit popsicle	S-I01
Pizza dough	O-B15
Pizza tomato sauce	O-B16
Plain genoise sponge	H09
Plain set yogurt	S-Y01
Professional 50%-butter brioche	S-B06
Puff puff	O-P05
Puff puff batter	O-B05
Raisin milk buns	M1-B06
Refrigerator cucumber pickles	O-B23
Roast chicken burger — ten-unit pilot	O-A01
Rolled and cut cake doughnuts	T01

Name	Recipe ID
Rosemary tray focaccia	H16
Samosa sealing paste	O-B30
Samosa wrapper dough	O-B29
Sandwich pan loaf / pain de mie	S-B04
Sausage roll filling	O-B10
Sausage rolls	O-P08
Scoopable vanilla ice cream	S-D02
Shawarma flatbread	O-B17
Shawarma slaw	O-B22
Shortcrust pie pastry	O-B07
Small sandwich rolls	M1-B11
Soft baguette-style bread	M1-B13
Soft burger buns	S-B05
Soft burger buns	M1-B09
Soft family bread	O-P01
Soft sandwich cookies	O-FBASE6
Soft shawarma flatbreads	M1-B10
Standard English block bread	M1-B01
Stirred mango yogurt	S-Y02
Sugar ring doughnuts	O-P04
Sweet milk buns	M1-B04
Sweet potato milk bread dough	O-B03
Tangzhong milk loaf	H02
Tea rolls with Roma margarine	M1-B03
Thin plantain chips	H17
Three milk soak	O-B33
True-butter pain beurre	S-B03
Vanilla condensed milk popsicle mix	O-FBASE2
Vanilla dairy soft serve	S-D01
Vanilla drinking yogurt	S-Y03
Vanilla pastry cream	H19
Vanilla soft serve cup or cone	O-F01
Vegetable samosas	S-F05
Whole egg dough rolls	O-P10

Name	Recipe ID
Yeast donuts: plain, glazed and beignets sucrés	S-P01
Yeast doughnut dough	O-B04
Yeast puff-puff / beignets farine	S-P02
Zebra chocolate milk loaf	H15

H2 companion: historical recipe content carried forward from H1. For the corrected baguette programme use BAG-H2-01 and PLAN-BAG-P/N/H in the operating volume.

Harmonized working edition H2 • 8 October 2026

This companion preserves the original workbook quantities alongside the owner-directed revision. Each L record is a distinct numerical ratio pattern, not necessarily a distinct product: it can be a historical experiment or an inconsistent scaling column. Do not manufacture directly from these tables. Use the selected working recipe or resolve the stated issue first.

Every original source stays unchanged. EDC and workbook butter become margarine; improver and Milk tantalizer are removed only in the proposed revision. Fryer charges, ambiguous milk, and unspecified additives remain held. Columns in a spreadsheet that have different ingredient ratios are recorded separately rather than silently called equivalent scales.

L001 Baguette AI

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B12 / M1-B13 / S-B01. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Baguette AI”, quantity column D. Source input sum 30,520.00 g; flour 18,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	18,000.00	'Baguette AI'!C5,D5
yeast	100.00	'Baguette AI'!C6,D6
salt	350.00	'Baguette AI'!C7,D7
ice water	12,000.00	'Baguette AI'!C8,D8
improver	70.00	'Baguette AI'!C9,D9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
yeast	5.56	27.78	0.56	9.26
salt	19.44	97.22	1.94	3.78
ice water	666.67	3,333.33	66.67	UNPRICED

Revised input sum 1,691.67 g; ×5 sum 8,458.33 g. Known price subtotal 433.04 FCFA; unpriced inputs: ice water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit improver: 70.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Baguette AI / D5 onward; S132 / Baguette AI / H5 onward. These repeated records are not independent trial evidence.

L002 Baguette AI

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B12 / M1-B13 / S-B01. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Baguette AI”, quantity column F. Source input sum 592.00 g; flour 350.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	350.00	'Baguette AI'!C5,F5
yeast	2.00	'Baguette AI'!C6,F6
salt	10.00	'Baguette AI'!C7,F7
ice water	210.00	'Baguette AI'!C8,F8
improver	20.00	'Baguette AI'!C9,F9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
yeast	5.71	28.57	0.57	9.52
salt	28.57	142.86	2.86	5.56
ice water	600.00	3,000.00	60.00	UNPRICED

Revised input sum 1,634.29 g; ×5 sum 8,171.43 g. Known price subtotal 435.08 FCFA; unpriced inputs: ice water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit improver: 20.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Baguette AI / F5 onward; S132 / Baguette AI / J5 onward. These repeated records are not independent trial evidence.

L003 Banh Mi

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B13; distinct Banh Mi trial remains open. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Banh Mi”, quantity column D. Source input sum 210,600.00 g; flour 120,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	120,000.00	'Banh Mi'!C5,D5
yeast	1,800.00	'Banh Mi'!C6,D6
sugar	900.00	'Banh Mi'!C7,D7
salt	900.00	'Banh Mi'!C8,D8
water	84,000.00	'Banh Mi'!C9,D9
improver	3,000.00	'Banh Mi'!C10,D10

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
yeast	15.00	75.00	1.50	25.00
sugar	7.50	37.50	0.75	4.80
salt	7.50	37.50	0.75	1.46
water	700.00	3,500.00	70.00	UNPRICED

Revised input sum 1,730.00 g; ×5 sum 8,650.00 g. Known price subtotal 451.26 FCFA; unpriced inputs: water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit improver: 3,000.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Banh Mi / D5 onward; S132 / Banh Mi / F5 onward; S132 / Banh Mi / H5 onward; S132 / Banh Mi / J5 onward; S044 / Banh Mi / D5 onward; S044 / Banh Mi / F5 onward; S044 / Banh Mi / H5 onward; S044 / Banh Mi / J5 onward; S045 / Banh Mi / D5 onward; S045 / Banh Mi / F5 onward; S045 / Banh Mi / H5 onward; S045 / Banh Mi / J5 onward; S046 / Banh Mi / D5 onward; S046 / Banh Mi / F5 onward; S046 / Banh Mi / H5 onward; S046 / Banh Mi / J5 onward; S047 / Banh Mi / D5 onward; S047 / Banh Mi / F5 onward; S047 / Banh Mi / H5 onward; S047 / Banh Mi / J5 onward; S076 / Banh Mi / D5 onward; S076 / Banh Mi / F5 onward; S076 / Banh Mi / H5 onward; S076 / Banh Mi / J5 onward; S077 / Banh Mi / D5 onward; S077 / Banh Mi / F5 onward; S077 / Banh Mi / H5 onward; S077 / Banh Mi / J5 onward; S078 / Banh Mi / D5 onward; S078 / Banh Mi / F5 onward; S078 / Banh Mi / H5 onward; S078 / Banh Mi / J5 onward; S085 / Banh Mi / D5 onward; S085 / Banh Mi / F5 onward; S085 / Banh Mi / H5 onward; S085 / Banh Mi / J5 onward; S086 / Banh Mi / D5 onward; S086 / Banh Mi / F5 onward; S086 / Banh Mi / H5 onward; S086 / Banh Mi / J5 onward; S093 / Banh Mi / D5 onward; S093 / Banh Mi / F5 onward; S093 / Banh Mi / H5 onward; S093 / Banh Mi / J5 onward; S094 / Banh Mi / D5 onward; S094 / Banh Mi / F5 onward; S094 / Banh Mi / H5 onward; S094 / Banh Mi / J5 onward; S101 / Banh Mi / D5 onward; S101 / Banh Mi / F5 onward; S101 / Banh Mi / H5 onward; S101 / Banh Mi / J5 onward; S106 / Banh Mi / D5 onward; S106 / Banh Mi / F5 onward; S106 / Banh Mi / H5 onward; S106 / Banh Mi / J5 onward; S136 / Banh Mi / B15 onward; S141 / Banh Mi / D5 onward; S141 / Banh Mi / F5 onward; S141 / Banh Mi / H5 onward; S141 / Banh Mi / J5 onward; S142 / Banh Mi / D5 onward; S142 / Banh Mi / F5 onward; S142 / Banh Mi / H5 onward; S142 / Banh Mi / J5 onward; S143 / Banh Mi / D5 onward; S143 / Banh Mi / F5 onward; S143 / Banh Mi / H5 onward; S143 / Banh Mi / J5 onward. These repeated records are not independent trial evidence.

L004 Beignet soufle

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H11. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Beignet soufle”, quantity column D. Source input sum 19,955.00 g; flour 10,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	10,000.00	'Beignet soufle'!C5,D5
Butter	1,600.00	'Beignet soufle'!C6,D6
sugar	2,000.00	'Beignet soufle'!C7,D7
Milk	500.00	'Beignet soufle'!C8,D8
egg	2,300.00	'Beignet soufle'!C9,D9
Baking powder	100.00	'Beignet soufle'!C10,D10
salt	100.00	'Beignet soufle'!C11,D11
water	3,300.00	'Beignet soufle'!C12,D12
improver	30.00	'Beignet soufle'!C13,D13
EDC	25.00	'Beignet soufle'!C14,D14

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	162.50	812.50	16.25	216.67
sugar	200.00	1,000.00	20.00	128.00
milk	50.00	250.00	5.00	UNPRICED
eggs	230.00	1,150.00	23.00	UNPRICED
baking powder	10.00	50.00	1.00	UNPRICED
salt	10.00	50.00	1.00	1.94
water	330.00	1,650.00	33.00	UNPRICED

Revised input sum 1,992.50 g; ×5 sum 9,962.50 g. Known price subtotal 766.61 FCFA; unpriced inputs: milk, eggs, baking powder, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 30.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Beignet soufle / D5 onward. These repeated records are not independent trial evidence.

L005 Beignet soufle

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H11. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Beignet soufle”, quantity column H. Source input sum 98,326.39 g; flour 50,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	50,000.00	'Beignet soufle'!C5,H5
Butter	6,666.67	'Beignet soufle'!C6,H6
sugar	9,166.67	'Beignet soufle'!C7,H7
Milk	2,083.33	'Beignet soufle'!C8,H8
egg	8,333.33	'Beignet soufle'!C9,H9
Baking powder	416.67	'Beignet soufle'!C10,H10
salt	500.00	'Beignet soufle'!C11,H11
water	20,833.33	'Beignet soufle'!C12,H12
improver	243.06	'Beignet soufle'!C13,H13
EDC	83.33	'Beignet soufle'!C14,H14

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	135.00	675.00	13.50	180.00

eggs	150.00	750.00	15.00	UNPRICED
salt	10.00	50.00	1.00	1.94
yeast	12.00	60.00	1.20	20.00
water	400.00	2,000.00	40.00	UNPRICED
butter for layers	240.00	1,200.00	24.00	UNPRICED

Revised input sum 2,312.00 g; ×5 sum 11,560.00 g. Known price subtotal 835.54 FCFA; unpriced inputs: milk, eggs, water, butter for layers. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 20.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; roll-in fat specification needed; Roma bucket suitability not established; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Croissant new / F5 onward; S132 / Croissant new / H5 onward; S132 / Croissant new / J5 onward. These repeated records are not independent trial evidence.

L015 Danisa biscuits

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H05. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Danisa biscuits”, quantity column D. Source input sum 35,590.00 g; flour 18,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell

yeast	11.11	55.56	1.11	18.52
water	333.33	1,666.67	33.33	UNPRICED
margarine	6.67	33.33	0.67	8.89

Revised input sum 1,561.11 g; ×5 sum 7,805.56 g. Known price subtotal 520.46 FCFA; unpriced inputs: milk, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit improver: 222.22 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Hamburger buns / F5 onward; S132 / Hamburger buns / H5 onward. These repeated records are not independent trial evidence.

L025 Ice Cream

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: O-FBASE1 / S-D01 / S-D02. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Ice Cream”, quantity column D. Source input sum 15,500.00 g; flour 0.00 g. Normalized basis 1,000 g original total input; after omissions the remaining total may be below 1,000 g.

Original ingredient	Source g	Source cell
Stabilizer	200.00	'Ice Cream'!C5,D5
Powdered Milk	1,100.00	'Ice Cream'!C6,D6
Sugar	2,000.00	'Ice Cream'!C7,D7
Water	12,000.00	'Ice Cream'!C8,D8
others	200.00	'Ice Cream'!C9,D9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
stabilizer	12.90	64.52	1.29	UNPRICED
powdered milk	70.97	354.84	7.10	227.10
sugar	129.03	645.16	12.90	82.58
water	774.19	3,870.97	77.42	UNPRICED
others	12.90	64.52	1.29	UNPRICED

Revised input sum 1,000.00 g; ×5 sum 5,000.00 g. Known price subtotal 309.68 FCFA; unpriced inputs: stabilizer, water, others. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: No ingredient identity or additive change required; normalize only.. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: stabilizer requires identity/specification; others requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Ice Cream / D5 onward; S132 / Ice Cream / F5 onward; S085 / Ice Cream / D5 onward; S085 / Ice Cream / F5 onward; S136 / Ice Cream / B15 onward. These repeated records are not independent trial evidence.

L026 Ice Cream

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: O-FBASE1 / S-D01 / S-D02. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Ice Cream”, quantity column H. Source input sum 5,300.00 g; flour 0.00 g. Normalized basis 1,000 g original total input; after omissions the remaining total may be below 1,000 g.

Original ingredient	Source g	Source cell
Stabilizer	3,500.00	'Ice Cream'!C5,H5
Powdered Milk	1,500.00	'Ice Cream'!C6,H6
Sugar	200.00	'Ice Cream'!C7,H7
Water	100.00	'Ice Cream'!C8,H8

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	152.50	762.50	15.25	203.33
sugar	100.00	500.00	10.00	64.00
milk	60.00	300.00	6.00	UNPRICED
eggs	50.00	250.00	5.00	UNPRICED
salt	10.00	50.00	1.00	1.94
yeast	14.00	70.00	1.40	23.33
water	250.00	1,250.00	25.00	UNPRICED
oil	22.00	110.00	2.20	31.09

Revised input sum 1,658.50 g; ×5 sum 8,292.50 g. Known price subtotal 743.70 FCFA; unpriced inputs: milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Sheet3 / F5 onward; S085 / Sheet3 / F5 onward; S086 / YUMMY BREAD / F5 onward. These repeated records are not independent trial evidence.

L045 Sheet3

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “Sheet3”, quantity column H. Source input sum 9,860.00 g; flour 5,000.00 g. Normalized basis 1,000 g total flour.

baking powder	1.00	5.00	0.10	UNPRICED
frying oil	450.00	2,250.00	45.00	635.87

Revised input sum 1,913.00 g; ×5 sum 9,565.00 g. Known price subtotal 1,126.25 FCFA; unpriced inputs: conc milk, eggs, water, baking powder. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 130.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: conc milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / Universal bread / J5 onward; S085 / Universal bread / J5 onward; S086 / Kouatchoua gato / J5 onward. These repeated records are not independent trial evidence.

L055 YUMMY BREAD

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B01–B13. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “YUMMY BREAD”, quantity column D. Source input sum 24,750.00 g; flour 15,000.00 g. Normalized basis 1,000 g total flour.

improver	60.00	'buns new look'!C11,H11
yeast	50.00	'buns new look'!C12,H12
water	1,500.00	'buns new look'!C13,H13
EDC	50.00	'buns new look'!C14,H14

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	90.00	450.00	9.00	120.00
sugar	60.00	300.00	6.00	38.40
milk	40.00	200.00	4.00	UNPRICED
eggs	80.00	400.00	8.00	UNPRICED
salt	10.00	50.00	1.00	1.94
yeast	10.00	50.00	1.00	16.67
water	300.00	1,500.00	30.00	UNPRICED

Revised input sum 1,590.00 g; ×5 sum 7,950.00 g. Known price subtotal 597.01 FCFA; unpriced inputs: milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 60.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S132 / buns new look / H5 onward; S132 / buns new look / J5 onward. These repeated records are not independent trial evidence.

L064 cake marbre

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H08. Similarity does not make the recipes equivalent.

Selected source record: S132, sheet “cake marbre”, quantity column D. Source input sum 5,227.00 g; flour 2,000.00 g. Normalized basis 1,000 g total flour.

Changes: Omit Improver: 120.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S045 / doughnuts / D5 onward; S045 / doughnuts / F5 onward. These repeated records are not independent trial evidence.

L094 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S045, sheet “doughnuts”, quantity column L. Source input sum 7,850.00 g; flour 5,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	5,000.00	'doughnuts'!C5,L5
baking powder	86.67	'doughnuts'!C6,L6
milk	333.33	'doughnuts'!C7,L7
oil	333.33	'doughnuts'!C9,L9
salt	56.67	'doughnuts'!C10,L10
Improver	40.00	'doughnuts'!C11,L11
eggs	2,000.00	'doughnuts'!C12,L12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	17.33	86.67	1.73	UNPRICED
milk	66.67	333.33	6.67	UNPRICED
oil	66.67	333.33	6.67	94.20
salt	11.33	56.67	1.13	2.20
eggs	400.00	2,000.00	40.00	UNPRICED

Revised input sum 1,562.00 g; ×5 sum 7,810.00 g. Known price subtotal 516.41 FCFA; unpriced inputs: baking powder, milk, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit Improver: 40.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S045 / doughnuts / L5 onward. These repeated records are not independent trial evidence.

L095 Best Chinchin

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H10. Similarity does not make the recipes equivalent.

Selected source record: S046, sheet “Best Chinchin”, quantity column D. Source input sum 43,800.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Best Chinchin'!C5,D5
baking powder	500.00	'Best Chinchin'!C6,D6
nut meg	50.00	'Best Chinchin'!C7,D7
sugar	4,500.00	'Best Chinchin'!C8,D8
Butter	4,500.00	'Best Chinchin'!C9,D9
egg	8,500.00	'Best Chinchin'!C10,D10
salt	150.00	'Best Chinchin'!C11,D11
Improver	200.00	'Best Chinchin'!C12,D12
oil	400.00	'Best Chinchin'!C13,D13

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	20.00	100.00	2.00	UNPRICED
nutmeg	2.00	10.00	0.20	UNPRICED
sugar	180.00	900.00	18.00	115.20
margarine	180.00	900.00	18.00	240.00
eggs	340.00	1,700.00	34.00	UNPRICED
salt	6.00	30.00	0.60	1.17
oil	16.00	80.00	1.60	22.61

Revised input sum 1,744.00 g; ×5 sum 8,720.00 g. Known price subtotal 798.98 FCFA; unpriced inputs: baking powder, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 200.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

sugar	1,500.00	'YUMMY YOGHOURT (YUYO)'!C6,L6
Cold Water	13,333.33	'YUMMY YOGHOURT (YUYO)'!C7,L7
vanilla	33.33	'YUMMY YOGHOURT (YUYO)'!C9,L9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
milk	143.95	719.77	14.40	UNPRICED
sugar	86.37	431.86	8.64	55.28
cold water	767.75	3,838.77	76.78	UNPRICED
vanilla	1.92	9.60	0.19	UNPRICED

Revised input sum 1,000.00 g; ×5 sum 5,000.00 g. Known price subtotal 55.28 FCFA; unpriced inputs: milk, cold water, vanilla. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: No ingredient identity or additive change required; normalize only.. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S046 / YUMMY YOGHOURT (YUYO) / L5 onward; S047 / YUMMY YOGHOURT (YUYO) / L5 onward; S094 / YUMMY YOGHOURT (YUYO) / L5 onward. These repeated records are not independent trial evidence.

L113 brioche

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B06; richer true-butter variant. Similarity does not make the recipes equivalent.

Selected source record: S046, sheet “brioche”, quantity column D. Source input sum 18,510.00 g; flour 10,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	10,000.00	'brioche'!C5,D5
Butter	2,500.00	'brioche'!C6,D6
sugar	1,500.00	'brioche'!C7,D7
Milk	1,000.00	'brioche'!C8,D8
egg	600.00	'brioche'!C9,D9
salt	120.00	'brioche'!C10,D10

baking powder	12.22	61.11	1.22	UNPRICED
chocolate	111.11	555.56	11.11	UNPRICED

Revised input sum 1,895.00 g; ×5 sum 9,475.00 g. Known price subtotal 677.67 FCFA; unpriced inputs: milk, eggs, water, baking powder, chocolate. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 666.67 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S048 / Galette / F5 onward; S048 / Galette / H5 onward; S092 / Galette / F5 onward; S092 / Galette / H5 onward. These repeated records are not independent trial evidence.

L123 Kouatchoua gato

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S048, sheet “Kouatchoua gato”, quantity column D. Source input sum 47,300.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Kouatchoua gato'!C5,D5
Butter	1,300.00	'Kouatchoua gato'!C6,D6
sugar	1,700.00	'Kouatchoua gato'!C7,D7

L133 butter biscuits

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S048, sheet “butter biscuits”, quantity column D. Source input sum 1,755.00 g; flour 1,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	1,000.00	'butter biscuits'!C5,D5
salt	5.00	'butter biscuits'!C6,D6
Butter	500.00	'butter biscuits'!C7,D7
sugar	250.00	'butter biscuits'!C8,D8

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
salt	5.00	25.00	0.50	0.97
margarine	500.00	2,500.00	50.00	666.67
sugar	250.00	1,250.00	25.00	160.00

Revised input sum 1,755.00 g; ×5 sum 8,775.00 g. Known price subtotal 1,247.64 FCFA; unpriced inputs: none among the listed ingredients. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S048 / butter biscuits / D5 onward; S048 / butter biscuits / F5 onward; S048 / butter biscuits / H5 onward; S092 / butter biscuits / D5 onward; S092 / butter biscuits / F5 onward; S092 / butter biscuits / H5 onward. These repeated records are not independent trial evidence.

L134 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S048, sheet “doughnuts”, quantity column D. Source input sum 618.00 g; flour 200.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	200.00	'doughnuts'!C5,D5
baking powder	50.00	'doughnuts'!C6,D6
milk	80.00	'doughnuts'!C7,D7
Butter	100.00	'doughnuts'!C8,D8
salt	3.00	'doughnuts'!C9,D9
Improver	30.00	'doughnuts'!C10,D10
nutmeg	5.00	'doughnuts'!C11,D11
eggs	150.00	'doughnuts'!C12,D12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	250.00	1,250.00	25.00	UNPRICED
milk	400.00	2,000.00	40.00	UNPRICED
margarine	500.00	2,500.00	50.00	666.67
salt	15.00	75.00	1.50	2.92
nutmeg	25.00	125.00	2.50	UNPRICED
eggs	750.00	3,750.00	75.00	UNPRICED

Revised input sum 2,940.00 g; ×5 sum 14,700.00 g. Known price subtotal 1,089.58 FCFA; unpriced inputs: baking powder, milk, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 30.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: baking powder exceeds 5% of flour; possible quantity error; milk requires identity/specification; nutmeg exceeds 2% of flour; probable source or cell-association error, do not produce from this record; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S048 / doughnuts / D5 onward; S077 / doughnuts / D5 onward; S092 / doughnuts / D5 onward; S093 / doughnuts / D5 onward; S094 / doughnuts / D5 onward; S101 / doughnuts / D5 onward; S106 / doughnuts / D5 onward; S141 / doughnuts / D5 onward; S142 / doughnuts / D5 onward; S142 / doughnuts / F5 onward; S143 / doughnuts / D5 onward. These repeated records are not independent trial evidence.

L135 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S048, sheet “doughnuts”, quantity column F. Source input sum 154,500.00 g; flour 50,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	50,000.00	'doughnuts'!C5,F5
baking powder	12,500.00	'doughnuts'!C6,F6
milk	20,000.00	'doughnuts'!C7,F7
Butter	25,000.00	'doughnuts'!C8,F8
salt	750.00	'doughnuts'!C9,F9
Improver	7,500.00	'doughnuts'!C10,F10
nutmeg	1,250.00	'doughnuts'!C11,F11
eggs	37,500.00	'doughnuts'!C12,F12
vanille	0.00	'doughnuts'!C13,F13

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	250.00	1,250.00	25.00	UNPRICED
milk	400.00	2,000.00	40.00	UNPRICED
margarine	500.00	2,500.00	50.00	666.67
salt	15.00	75.00	1.50	2.92
nutmeg	25.00	125.00	2.50	UNPRICED
eggs	750.00	3,750.00	75.00	UNPRICED
vanille	0.00	0.00	0.00	UNPRICED

Revised input sum 2,940.00 g; ×5 sum 14,700.00 g. Known price subtotal 1,089.58 FCFA; unpriced inputs: baking powder, milk, nutmeg, eggs, vanille. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 7,500.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: baking powder exceeds 5% of flour; possible quantity error; milk requires identity/specification; nutmeg exceeds 2% of flour; probable source or cell-association error, do not produce from this record; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S048 / doughnuts / F5 onward; S048 / doughnuts / H5 onward; S077 / doughnuts / F5 onward; S077 / doughnuts / H5 onward; S092 / doughnuts / F5 onward; S092 / doughnuts / H5 onward; S093 / doughnuts / F5 onward; S093 / doughnuts / H5 onward; S094 / doughnuts / F5 onward; S094 / doughnuts / H5 onward; S101 / doughnuts / F5 onward; S101 / doughnuts / H5 onward; S106 / doughnuts / F5 onward; S106 / doughnuts / H5 onward; S141 / doughnuts / F5 onward; S141 / doughnuts / H5 onward; S143 / doughnuts / F5 onward; S143 / doughnuts / H5 onward. These repeated records are not independent trial evidence.

L136 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S048, sheet “doughnuts”, quantity column L. Source input sum 22,925.00 g; flour 5,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	5,000.00	'doughnuts'!C5,L5
baking powder	1,250.00	'doughnuts'!C6,L6
milk	2,000.00	'doughnuts'!C7,L7
Butter	2,500.00	'doughnuts'!C8,L8
salt	75.00	'doughnuts'!C9,L9
Improver	750.00	'doughnuts'!C10,L10
nutmeg	9,000.00	'doughnuts'!C11,L11
eggs	2,350.00	'doughnuts'!C12,L12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	250.00	1,250.00	25.00	UNPRICED
milk	400.00	2,000.00	40.00	UNPRICED
margarine	500.00	2,500.00	50.00	666.67
salt	15.00	75.00	1.50	2.92
nutmeg	1,800.00	9,000.00	180.00	UNPRICED
eggs	470.00	2,350.00	47.00	UNPRICED

Revised input sum 4,435.00 g; ×5 sum 22,175.00 g. Known price subtotal 1,089.58 FCFA; unpriced inputs: baking powder, milk, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 750.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: baking powder exceeds 5% of flour; possible quantity error; milk requires identity/specification; nutmeg exceeds 2% of flour; probable source or cell-association error, do not produce from this record; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S048 / doughnuts / L5 onward; S077 / doughnuts / L5 onward; S092 / doughnuts / L5 onward; S093 / doughnuts / L5 onward; S094 / doughnuts / L5 onward; S101 / doughnuts / L5 onward; S106 / doughnuts / L5 onward; S142 / doughnuts / L5 onward; S143 / doughnuts / L5 onward. These repeated records are not independent trial evidence.

L137 Best Chinchin

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H10. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Best Chinchin”, quantity column D. Source input sum 47,760.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Best Chinchin'!C5,D5
baking powder	400.00	'Best Chinchin'!C6,D6
nut meg	50.00	'Best Chinchin'!C7,D7
sugar	4,500.00	'Best Chinchin'!C8,D8
Butter	4,000.00	'Best Chinchin'!C9,D9
egg	13,500.00	'Best Chinchin'!C10,D10
salt	90.00	'Best Chinchin'!C11,D11
Improver	200.00	'Best Chinchin'!C12,D12
oil	20.00	'Best Chinchin'!C13,D13

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	16.00	80.00	1.60	UNPRICED
nutmeg	2.00	10.00	0.20	UNPRICED
sugar	180.00	900.00	18.00	115.20
margarine	160.00	800.00	16.00	213.33
eggs	540.00	2,700.00	54.00	UNPRICED
salt	3.60	18.00	0.36	0.70
oil	0.80	4.00	0.08	1.13

Revised input sum 1,902.40 g; ×5 sum 9,512.00 g. Known price subtotal 750.36 FCFA; unpriced inputs: baking powder, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 200.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / Best Chinchin / D5 onward; S076 / Best Chinchin / F5 onward; S076 / Best Chinchin / H5 onward; S078 / Best Chinchin / D5 onward; S078 / Best Chinchin / F5 onward; S078 / Best Chinchin / H5 onward; S105 / Best Chinchin / D5 onward; S105 / Best Chinchin / F5 onward; S105 / Best Chinchin / H5 onward. These repeated records are not independent trial evidence.

L138 Cake Prof

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H08 / H09; exact style differs. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Cake Prof”, quantity column D. Source input sum 6,855.00 g; flour 2,600.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	2,600.00	'Cake Prof'!C5,D5
baking powder	80.00	'Cake Prof'!C6,D6
salt	30.00	'Cake Prof'!C7,D7
Nut Meg	45.00	'Cake Prof'!C8,D8
Egg	1,800.00	'Cake Prof'!C9,D9
Butter	1,500.00	'Cake Prof'!C10,D10
sugar	800.00	'Cake Prof'!C11,D11

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	30.77	153.85	3.08	UNPRICED
salt	11.54	57.69	1.15	2.24
nutmeg	17.31	86.54	1.73	UNPRICED
eggs	692.31	3,461.54	69.23	UNPRICED
margarine	576.92	2,884.62	57.69	769.23
sugar	307.69	1,538.46	30.77	196.92

Revised input sum 2,636.54 g; ×5 sum 13,182.69 g. Known price subtotal 1,388.40 FCFA; unpriced inputs: baking powder, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / Cake Prof / D5 onward; S076 / Cake Prof / F5 onward; S076 / Cake Prof / H5 onward; S077 / Cake Prof / D5 onward; S077 / Cake Prof / F5 onward; S077 / Cake Prof / H5 onward; S078 / Cake Prof / D5 onward; S078 / Cake Prof / F5 onward; S078 / Cake Prof / H5 onward. These repeated records are not independent trial evidence.

L139 NEW BRIOCHE

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B06; richer true-butter variant. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “NEW BRIOCHE”, quantity column D. Source input sum 9,533.00 g; flour 4,500.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	4,500.00	'NEW BRIOCHE'!C5,D5
Butter	2,500.00	'NEW BRIOCHE'!C6,D6
sugar	600.00	'NEW BRIOCHE'!C7,D7
Milk	500.00	'NEW BRIOCHE'!C8,D8
egg	350.00	'NEW BRIOCHE'!C9,D9
salt	35.00	'NEW BRIOCHE'!C10,D10
improver	50.00	'NEW BRIOCHE'!C11,D11
yeast	50.00	'NEW BRIOCHE'!C12,D12
water	900.00	'NEW BRIOCHE'!C13,D13
Milk tantalizer	8.00	'NEW BRIOCHE'!C14,D14
EDC	25.00	'NEW BRIOCHE'!C15,D15
Nutmeg	15.00	'NEW BRIOCHE'!C16,D16

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	561.11	2,805.56	56.11	748.15
sugar	133.33	666.67	13.33	85.33
milk	111.11	555.56	11.11	UNPRICED
eggs	77.78	388.89	7.78	UNPRICED
salt	7.78	38.89	0.78	1.51
yeast	11.11	55.56	1.11	18.52
water	200.00	1,000.00	20.00	UNPRICED
nutmeg	3.33	16.67	0.33	UNPRICED

Revised input sum 2,105.56 g; ×5 sum 10,527.78 g. Known price subtotal 1,273.51 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 50.00 g in the source batch; Omit Milk tantalizer: 8.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / NEW BRIOCHE / D5 onward; S076 / NEW BRIOCHE / F5 onward; S076 / NEW BRIOCHE / H5 onward. These repeated records are not independent trial evidence.

L140 Pain au lait

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B07 / M1-B04. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Pain au lait”, quantity column D. Source input sum 19,907.00 g; flour 12,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	12,000.00	'Pain au lait'!C5,D5
Butter	900.00	'Pain au lait'!C6,D6
sugar	1,100.00	'Pain au lait'!C7,D7
Milk	1,000.00	'Pain au lait'!C8,D8
egg	300.00	'Pain au lait'!C9,D9
salt	85.00	'Pain au lait'!C10,D10
improver	100.00	'Pain au lait'!C11,D11
yeast	80.00	'Pain au lait'!C12,D12
water	4,000.00	'Pain au lait'!C13,D13
Oil	300.00	'Pain au lait'!C14,D14
Milk tantalizer	5.00	'Pain au lait'!C15,D15
EDC	25.00	'Pain au lait'!C16,D16
Nutmeg	12.00	'Pain au lait'!C17,D17

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	77.08	385.42	7.71	102.78
sugar	91.67	458.33	9.17	58.67
milk	83.33	416.67	8.33	UNPRICED
eggs	25.00	125.00	2.50	UNPRICED
salt	7.08	35.42	0.71	1.38
yeast	6.67	33.33	0.67	11.11
water	333.33	1,666.67	33.33	UNPRICED
oil	25.00	125.00	2.50	35.33
nutmeg	1.00	5.00	0.10	UNPRICED

Revised input sum 1,650.17 g; ×5 sum 8,250.83 g. Known price subtotal 629.26 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; Omit Milk tantalizer: 5.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / Pain au lait / D5 onward; S076 / Pain au lait / F5 onward; S076 / Pain au lait / H5 onward. These repeated records are not independent trial evidence.

L141 Pain au lait

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B07 / M1-B04. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Pain au lait”, quantity column L. Source input sum 10,321.00 g; flour 7,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	7,000.00	'Pain au lait'!C5,L5
Butter	600.00	'Pain au lait'!C6,L6
sugar	600.00	'Pain au lait'!C7,L7
Milk	500.00	'Pain au lait'!C8,L8
egg	150.00	'Pain au lait'!C9,L9
salt	50.00	'Pain au lait'!C10,L10

yeast	7.14	35.71	0.71	11.90
water	157.14	785.71	15.71	UNPRICED
oil	21.43	107.14	2.14	30.28
nutmeg	0.86	4.29	0.09	UNPRICED

Revised input sum 1,459.79 g; ×5 sum 7,298.93 g. Known price subtotal 635.10 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; Omit Milk tantalizer: 2.50 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / Pain au lait / L5 onward; S142 / Pain au lait / L5 onward. These repeated records are not independent trial evidence.

L142 Sugar Balls

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Sugar Balls”, quantity column D. Source input sum 6,720.00 g; flour 4,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	4,000.00	'Sugar Balls'!C5,D5
baking powder	40.00	'Sugar Balls'!C6,D6
sugar	400.00	'Sugar Balls'!C7,D7
Butter	400.00	'Sugar Balls'!C8,D8
salt	30.00	'Sugar Balls'!C9,D9
Cold Water	1,700.00	'Sugar Balls'!C10,D10
Improver	30.00	'Sugar Balls'!C11,D11
yeast	120.00	'Sugar Balls'!C12,D12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	10.00	50.00	1.00	UNPRICED
sugar	100.00	500.00	10.00	64.00
margarine	100.00	500.00	10.00	133.33
salt	7.50	37.50	0.75	1.46
cold water	425.00	2,125.00	42.50	UNPRICED
yeast	30.00	150.00	3.00	50.00

Revised input sum 1,672.50 g; ×5 sum 8,362.50 g. Known price subtotal 668.79 FCFA; unpriced inputs: baking powder, cold water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 30.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S076 / Sugar Balls / D5 onward; S076 / Sugar Balls / F5 onward; S076 / Sugar Balls / L5 onward. These repeated records are not independent trial evidence.

L143 Sugar Balls

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S076, sheet “Sugar Balls”, quantity column H. Source input sum 33,200.40 g; flour 20,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	20,000.00	'Sugar Balls'!C5,H5
baking powder	200.00	'Sugar Balls'!C6,H6

Nutmeg	12.00	'KUMBA BREAD'!C17,D17

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	89.29	446.43	8.93	119.05
sugar	85.71	428.57	8.57	54.86
milk	71.43	357.14	7.14	UNPRICED
eggs	57.14	285.71	5.71	UNPRICED
salt	7.14	35.71	0.71	1.39
yeast	7.14	35.71	0.71	11.90
water	271.43	1,357.14	27.14	UNPRICED
oil	22.86	114.29	2.29	32.30
nutmeg	1.71	8.57	0.17	UNPRICED

Revised input sum 1,613.86 g; ×5 sum 8,069.29 g. Known price subtotal 639.50 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 60.00 g in the source batch; Omit Milk tantalizer: 5.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S078 / KUMBA BREAD / D5 onward; S078 / KUMBA BREAD / F5 onward; S078 / KUMBA BREAD / H5 onward. These repeated records are not independent trial evidence.

L161 KUMBA BREAD

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B02. Similarity does not make the recipes equivalent.

Selected source record: S078, sheet “KUMBA BREAD”, quantity column L. Source input sum 10,051.00 g; flour 7,000.00 g. Normalized basis 1,000 g total flour.

L180 buns new look

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B04 / M1-B09. Similarity does not make the recipes equivalent.

Selected source record: S085, sheet “buns new look”, quantity column D. Source input sum 9,870.00 g; flour 6,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	6,000.00	'buns new look'!C5,D5
Butter	300.00	'buns new look'!C6,D6
sugar	50.00	'buns new look'!C7,D7
conc milk	500.00	'buns new look'!C8,D8
egg	220.00	'buns new look'!C9,D9
salt	100.00	'buns new look'!C10,D10
improver	100.00	'buns new look'!C11,D11
yeast	100.00	'buns new look'!C12,D12
water	2,500.00	'buns new look'!C13,D13

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	50.00	250.00	5.00	66.67
sugar	8.33	41.67	0.83	5.33
conc milk	83.33	416.67	8.33	UNPRICED
eggs	36.67	183.33	3.67	UNPRICED
salt	16.67	83.33	1.67	3.24
yeast	16.67	83.33	1.67	27.78
water	416.67	2,083.33	41.67	UNPRICED

Revised input sum 1,628.33 g; ×5 sum 8,141.67 g. Known price subtotal 523.02 FCFA; unpriced inputs: conc milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: conc milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S085 / buns new look / D5 onward; S085 / buns new look / F5 onward; S136 / buns new look / B15 onward. These repeated records are not independent trial evidence.

L181 Best Chinchin

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H10. Similarity does not make the recipes equivalent.

Selected source record: S086, sheet “Best Chinchin”, quantity column D. Source input sum 60,850.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Best Chinchin'!C5,D5
baking powder	500.00	'Best Chinchin'!C6,D6
nut meg	50.00	'Best Chinchin'!C7,D7
sugar	4,500.00	'Best Chinchin'!C8,D8
Butter	4,000.00	'Best Chinchin'!C9,D9
egg	11,000.00	'Best Chinchin'!C10,D10
salt	200.00	'Best Chinchin'!C11,D11
Improver	200.00	'Best Chinchin'!C12,D12
oil	400.00	'Best Chinchin'!C13,D13
oil	15,000.00	'Best Chinchin'!C14,D14

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	20.00	100.00	2.00	UNPRICED
nutmeg	2.00	10.00	0.20	UNPRICED
sugar	180.00	900.00	18.00	115.20
margarine	160.00	800.00	16.00	213.33
eggs	440.00	2,200.00	44.00	UNPRICED
salt	8.00	40.00	0.80	1.56
oil	616.00	3,080.00	61.60	870.43

Revised input sum 2,426.00 g; ×5 sum 12,130.00 g. Known price subtotal 1,620.52 FCFA; unpriced inputs: baking powder, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 200.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S086 / Best Chinchin / D5 onward; S086 / Best Chinchin / F5 onward; S086 / Best Chinchin / H5 onward. These repeated records are not independent trial evidence.

L182 Donuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S086, sheet “Donuts”, quantity column D. Source input sum 26,290.00 g; flour 11,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	11,000.00	'Donuts'!C5,D5
baking powder	190.00	'Donuts'!C6,D6
milk	500.00	'Donuts'!C7,D7
salt	110.00	'Donuts'!C8,D8
Sugar	1,000.00	'Donuts'!C9,D9
Improver	90.00	'Donuts'!C10,D10
eggs	900.00	'Donuts'!C11,D11
water	7,500.00	'Donuts'!C12,D12
oil	5,000.00	'Donuts'!C13,D13

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	17.27	86.36	1.73	UNPRICED
milk	45.45	227.27	4.55	UNPRICED
salt	10.00	50.00	1.00	1.94
sugar	90.91	454.55	9.09	58.18
eggs	81.82	409.09	8.18	UNPRICED
water	681.82	3,409.09	68.18	UNPRICED
oil	454.55	2,272.73	45.45	642.29

Revised input sum 2,381.82 g; ×5 sum 11,909.09 g. Known price subtotal 1,122.42 FCFA; unpriced inputs: baking powder, milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit Improver: 90.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S086 / Donuts / D5 onward; S086 / Donuts / F5 onward; S086 / Donuts / J5 onward. These repeated records are not independent trial evidence.

L183 Galette

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H14. Similarity does not make the recipes equivalent.

Selected source record: S086, sheet “Galette”, quantity column D. Source input sum 18,245.00 g; flour 10,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	10,000.00	'Galette'!C5,D5
Butter	1,000.00	'Galette'!C6,D6
sugar	1,000.00	'Galette'!C7,D7
Milk	800.00	'Galette'!C8,D8
egg	500.00	'Galette'!C9,D9
salt	110.00	'Galette'!C10,D10
improver	100.00	'Galette'!C11,D11
yeast	80.00	'Galette'!C12,D12
water	3,500.00	'Galette'!C13,D13
baking powder	80.00	'Galette'!C14,D14
Chocolate	1,000.00	'Galette'!C15,D15
EDC	75.00	'Galette'!C16,D16

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	107.50	537.50	10.75	143.33
sugar	100.00	500.00	10.00	64.00
milk	80.00	400.00	8.00	UNPRICED
eggs	50.00	250.00	5.00	UNPRICED
salt	11.00	55.00	1.10	2.14
yeast	8.00	40.00	0.80	13.33
water	350.00	1,750.00	35.00	UNPRICED
baking powder	8.00	40.00	0.80	UNPRICED
chocolate	100.00	500.00	10.00	UNPRICED

Revised input sum 1,814.50 g; ×5 sum 9,072.50 g. Known price subtotal 642.81 FCFA; unpriced inputs: milk, eggs, water, baking powder, chocolate. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S086 / Galette / D5 onward; S086 / Galette / F5 onward. These repeated records are not independent trial evidence.

L184 Melto

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H06. Similarity does not make the recipes equivalent.

Selected source record: S086, sheet “Melto”, quantity column H. Source input sum 6,300.00 g; flour 3,500.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	3,500.00	'Melto'!C5,H5
Butter	1,700.00	'Melto'!C6,H6
icing sugar	200.00	'Melto'!C7,H7
egg	50.00	'Melto'!C8,H8
milk	100.00	'Melto'!C9,H9
sugar	500.00	'Melto'!C10,H10
salt	250.00	'Melto'!C11,H11

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	485.71	2,428.57	48.57	647.62
icing sugar	57.14	285.71	5.71	UNPRICED
eggs	14.29	71.43	1.43	UNPRICED
milk	28.57	142.86	2.86	UNPRICED
sugar	142.86	714.29	14.29	91.43
salt	71.43	357.14	7.14	13.89

Revised input sum 1,800.00 g; ×5 sum 9,000.00 g. Known price subtotal 1,172.94 FCFA; unpriced inputs: icing sugar, eggs, milk. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; salt exceeds 3% of flour; review before testing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S086 / Melto / H5 onward. These repeated records are not independent trial evidence.

L185 YUMMY BREAD

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B01–B13. Similarity does not make the recipes equivalent.

Selected source record: S086, sheet “YUMMY BREAD”, quantity column D. Source input sum 25,650.00 g; flour 15,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	15,000.00	'YUMMY BREAD'!C5,D5
Butter	1,500.00	'YUMMY BREAD'!C6,D6
sugar	1,500.00	'YUMMY BREAD'!C7,D7
Milk	1,000.00	'YUMMY BREAD'!C8,D8
egg	750.00	'YUMMY BREAD'!C9,D9
salt	120.00	'YUMMY BREAD'!C10,D10
improver	120.00	'YUMMY BREAD'!C11,D11
yeast	160.00	'YUMMY BREAD'!C12,D12
water	5,000.00	'YUMMY BREAD'!C13,D13
Oil	400.00	'YUMMY BREAD'!C14,D14
EDC	100.00	'YUMMY BREAD'!C15,D15

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	106.67	533.33	10.67	142.22
sugar	100.00	500.00	10.00	64.00
milk	66.67	333.33	6.67	UNPRICED
eggs	50.00	250.00	5.00	UNPRICED
salt	8.00	40.00	0.80	1.56
yeast	10.67	53.33	1.07	17.78
water	333.33	1,666.67	33.33	UNPRICED
oil	26.67	133.33	2.67	37.68

Revised input sum 1,702.00 g; ×5 sum 8,510.00 g. Known price subtotal 683.24 FCFA; unpriced inputs: milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 120.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S086 / YUMMY BREAD / D5 onward; S086 / YUMMY BREAD / J5 onward. These repeated records are not independent trial evidence.

L186 Best Chinchin

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H10. Similarity does not make the recipes equivalent.

Selected source record: S093, sheet “Best Chinchin”, quantity column D. Source input sum 42,250.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Best Chinchin'!C5,D5
baking powder	500.00	'Best Chinchin'!C6,D6
nut meg	50.00	'Best Chinchin'!C7,D7
sugar	4,500.00	'Best Chinchin'!C8,D8

baking powder	1.00	5.00	0.10	UNPRICED
frying oil	450.00	2,250.00	45.00	635.87

Revised input sum 1,915.00 g; ×5 sum 9,575.00 g. Known price subtotal 1,126.25 FCFA; unpriced inputs: conc milk, eggs, water, nutmeg, baking powder. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 150.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: conc milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S093 / Kouatchoua gato / J5 onward; S101 / Kouatchoua gato / J5 onward; S143 / Kouatchoua gato / J5 onward. These repeated records are not independent trial evidence.

L190 Sugar Balls

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S093, sheet “Sugar Balls”, quantity column D. Source input sum 8,560.00 g; flour 5,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell

L219 Kouatchoua gato

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S106, sheet “Kouatchoua gato”, quantity column D. Source input sum 48,810.00 g; flour 25,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	25,000.00	'Kouatchoua gato'!C5,D5
Butter	1,300.00	'Kouatchoua gato'!C6,D6
sugar	1,700.00	'Kouatchoua gato'!C7,D7
Conc Milk	800.00	'Kouatchoua gato'!C8,D8
egg	750.00	'Kouatchoua gato'!C9,D9
salt	270.00	'Kouatchoua gato'!C10,D10
improver	150.00	'Kouatchoua gato'!C11,D11
yeast	170.00	'Kouatchoua gato'!C12,D12
water	9,500.00	'Kouatchoua gato'!C13,D13
baking powder	170.00	'Kouatchoua gato'!C14,D14
frying oil	9,000.00	'Kouatchoua gato'!C15,D15

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	52.00	260.00	5.20	69.33
sugar	68.00	340.00	6.80	43.52
conc milk	32.00	160.00	3.20	UNPRICED
eggs	30.00	150.00	3.00	UNPRICED
salt	10.80	54.00	1.08	2.10
yeast	6.80	34.00	0.68	11.33
water	380.00	1,900.00	38.00	UNPRICED
baking powder	6.80	34.00	0.68	UNPRICED
frying oil	360.00	1,800.00	36.00	508.70

Revised input sum 1,946.40 g; ×5 sum 9,732.00 g. Known price subtotal 1,054.98 FCFA; unpriced inputs: conc milk, eggs, water, baking powder. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 150.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: conc milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S106 / Kouatchoua gato / D5 onward; S106 / Kouatchoua gato / F5 onward; S106 / Kouatchoua gato / H5 onward. These repeated records are not independent trial evidence.

L220 Kouatchoua gato

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: Retain unique variant; no equivalent operating card selected. Similarity does not make the recipes equivalent.

Selected source record: S106, sheet “Kouatchoua gato”, quantity column J. Source input sum 38,410.00 g; flour 20,000.00 g. Normalized basis 1,000 g total flour.

water	200.00	1,000.00	20.00	UNPRICED
nutmeg	2.31	11.54	0.23	UNPRICED

Revised input sum 1,963.85 g; ×5 sum 9,819.23 g. Known price subtotal 1,049.95 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; Omit Milk tantalizer: 2.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S140 / NEW BRIOCHE / D5 onward; S140 / NEW BRIOCHE / F5 onward; S140 / NEW BRIOCHE / H5 onward. These repeated records are not independent trial evidence.

L230 Pain au lait

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-B07 / M1-B04. Similarity does not make the recipes equivalent.

Selected source record: S140, sheet “Pain au lait”, quantity column D. Source input sum 40,314.15 g; flour 12,000.00 g. Normalized basis 1,000 g total flour.

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	10.00	50.00	1.00	UNPRICED
sugar	100.00	500.00	10.00	64.00
margarine	100.00	500.00	10.00	133.33
salt	14.00	70.00	1.40	2.72
cold water	400.00	2,000.00	40.00	UNPRICED
yeast	9.35	46.76	0.94	15.59

Revised input sum 1,633.35 g; ×5 sum 8,166.76 g. Known price subtotal 635.64 FCFA; unpriced inputs: baking powder, cold water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 500.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S141 / Sugar Balls / H5 onward. These repeated records are not independent trial evidence.

L239 YUMMY BREAD

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B01–B13. Similarity does not make the recipes equivalent.

Selected source record: S141, sheet “YUMMY BREAD”, quantity column D. Source input sum 15,252.00 g; flour 9,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	9,000.00	'YUMMY BREAD'!C5,D5
Butter	1,000.00	'YUMMY BREAD'!C6,D6
sugar	900.00	'YUMMY BREAD'!C7,D7
Milk	750.00	'YUMMY BREAD'!C8,D8
egg	500.00	'YUMMY BREAD'!C9,D9
salt	100.00	'YUMMY BREAD'!C10,D10
improver	100.00	'YUMMY BREAD'!C11,D11
yeast	140.00	'YUMMY BREAD'!C12,D12
water	2,500.00	'YUMMY BREAD'!C13,D13
Oil	220.00	'YUMMY BREAD'!C14,D14

EDC	25.00	'YUMMY BREAD'!C16,D16
Nutmeg	12.00	'YUMMY BREAD'!C17,D17

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	113.89	569.44	11.39	151.85
sugar	100.00	500.00	10.00	64.00
milk	83.33	416.67	8.33	UNPRICED
eggs	55.56	277.78	5.56	UNPRICED
salt	11.11	55.56	1.11	2.16
yeast	15.56	77.78	1.56	25.93
water	277.78	1,388.89	27.78	UNPRICED
oil	24.44	122.22	2.44	34.54
nutmeg	1.33	6.67	0.13	UNPRICED

Revised input sum 1,683.00 g; ×5 sum 8,415.00 g. Known price subtotal 698.48 FCFA; unpriced inputs: milk, eggs, water, nutmeg. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 100.00 g in the source batch; Omit Milk tantalizer: 5.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S141 / YUMMY BREAD / D5 onward; S141 / YUMMY BREAD / F5 onward. These repeated records are not independent trial evidence.

L240 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S141, sheet “doughnuts”, quantity column L. Source input sum 23,375.00 g; flour 5,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	5,000.00	'doughnuts'!C5,L5
baking powder	1,250.00	'doughnuts'!C6,L6
milk	2,000.00	'doughnuts'!C7,L7
Butter	2,500.00	'doughnuts'!C8,L8
salt	75.00	'doughnuts'!C9,L9
Improver	750.00	'doughnuts'!C10,L10
nutmeg	9,000.00	'doughnuts'!C11,L11
eggs	2,800.00	'doughnuts'!C12,L12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	250.00	1,250.00	25.00	UNPRICED
milk	400.00	2,000.00	40.00	UNPRICED
margarine	500.00	2,500.00	50.00	666.67
salt	15.00	75.00	1.50	2.92
nutmeg	1,800.00	9,000.00	180.00	UNPRICED
eggs	560.00	2,800.00	56.00	UNPRICED

Revised input sum 4,525.00 g; ×5 sum 22,625.00 g. Known price subtotal 1,089.58 FCFA; unpriced inputs: baking powder, milk, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 750.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: baking powder exceeds 5% of flour; possible quantity error; milk requires identity/specification; nutmeg exceeds 2% of flour; probable source or cell-association error, do not produce from this record; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S141 / doughnuts / L5 onward. These repeated records are not independent trial evidence.

L241 Galette

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H14. Similarity does not make the recipes equivalent.

Selected source record: S142, sheet “Galette”, quantity column D. Source input sum 18,665.00 g; flour 10,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	10,000.00	'Galette'!C5,D5
Butter	1,100.00	'Galette'!C6,D6
sugar	1,100.00	'Galette'!C7,D7

oil	15,000.00	'beignet souffle'!C15,F15

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
oil	380.00	1,900.00	38.00	536.96
sugar	100.00	500.00	10.00	64.00
milk	100.00	500.00	10.00	UNPRICED
eggs	150.00	750.00	15.00	UNPRICED
salt	12.00	60.00	1.20	2.33
water	500.00	2,500.00	50.00	UNPRICED
baking powder	12.00	60.00	1.20	UNPRICED
margarine	12.00	60.00	1.20	16.00

Revised input sum 2,266.00 g; ×5 sum 11,330.00 g. Known price subtotal 1,039.29 FCFA; unpriced inputs: milk, eggs, water, baking powder. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Omit improver: 600.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S142 / beignet souffle / F5 onward; S142 / beignet souffle / H5 onward. These repeated records are not independent trial evidence.

L249 doughnuts

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: T01 for cake / O-P04 for yeast. Similarity does not make the recipes equivalent.

Selected source record: S142, sheet “doughnuts”, quantity column H. Source input sum 25,520.00 g; flour 10,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	10,000.00	'doughnuts'!C5,H5
baking powder	120.00	'doughnuts'!C6,H6
milk	1,000.00	'doughnuts'!C7,H7
Butter	5,000.00	'doughnuts'!C8,H8
salt	150.00	'doughnuts'!C9,H9
Improver	1,500.00	'doughnuts'!C10,H10
nutmeg	250.00	'doughnuts'!C11,H11
eggs	7,500.00	'doughnuts'!C12,H12

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	12.00	60.00	1.20	UNPRICED
milk	100.00	500.00	10.00	UNPRICED
margarine	500.00	2,500.00	50.00	666.67
salt	15.00	75.00	1.50	2.92
nutmeg	25.00	125.00	2.50	UNPRICED
eggs	750.00	3,750.00	75.00	UNPRICED

Revised input sum 2,402.00 g; ×5 sum 12,010.00 g. Known price subtotal 1,089.58 FCFA; unpriced inputs: baking powder, milk, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit Improver: 1,500.00 g in the source batch. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; nutmeg exceeds 2% of flour; probable source or cell-association error, do not produce from this record; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S142 / doughnuts / H5 onward. These repeated records are not independent trial evidence.

L250 Cake Prof

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: H08 / H09; exact style differs. Similarity does not make the recipes equivalent.

Selected source record: S143, sheet “Cake Prof”, quantity column D. Source input sum 6,705.00 g; flour 2,500.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	2,500.00	'Cake Prof'!C5,D5
baking powder	80.00	'Cake Prof'!C6,D6
salt	30.00	'Cake Prof'!C7,D7

Egg	1,650.00	'Cake Prof'!C9,D9
Butter	1,500.00	'Cake Prof'!C10,D10
sugar	900.00	'Cake Prof'!C11,D11

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
baking powder	32.00	160.00	3.20	UNPRICED
salt	12.00	60.00	1.20	2.33
nutmeg	18.00	90.00	1.80	UNPRICED
eggs	660.00	3,300.00	66.00	UNPRICED
margarine	600.00	3,000.00	60.00	800.00
sugar	360.00	1,800.00	36.00	230.40

Revised input sum 2,682.00 g; ×5 sum 13,410.00 g. Known price subtotal 1,452.73 FCFA; unpriced inputs: baking powder, nutmeg, eggs. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S143 / Cake Prof / D5 onward; S143 / Cake Prof / F5 onward; S143 / Cake Prof / H5 onward. These repeated records are not independent trial evidence.

L251 YUMMY BREAD

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: M1-B01–B13. Similarity does not make the recipes equivalent.

Selected source record: S143, sheet “YUMMY BREAD”, quantity column D. Source input sum 20,570.00 g; flour 12,000.00 g. Normalized basis 1,000 g total flour.

Original ingredient	Source g	Source cell
flour	12,000.00	'YUMMY BREAD'!C5,D5
Butter	1,500.00	'YUMMY BREAD'!C6,D6
sugar	1,500.00	'YUMMY BREAD'!C7,D7
Milk	1,000.00	'YUMMY BREAD'!C8,D8
egg	600.00	'YUMMY BREAD'!C9,D9
salt	120.00	'YUMMY BREAD'!C10,D10
improver	120.00	'YUMMY BREAD'!C11,D11
yeast	160.00	'YUMMY BREAD'!C12,D12
water	3,200.00	'YUMMY BREAD'!C13,D13
Oil	300.00	'YUMMY BREAD'!C14,D14
Milk tantalizer	20.00	'YUMMY BREAD'!C15,D15
EDC	50.00	'YUMMY BREAD'!C16,D16

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
flour	1,000.00	5,000.00	100.00	420.00
margarine	129.17	645.83	12.92	172.22
sugar	125.00	625.00	12.50	80.00
milk	83.33	416.67	8.33	UNPRICED
eggs	50.00	250.00	5.00	UNPRICED
salt	10.00	50.00	1.00	1.94
yeast	13.33	66.67	1.33	22.22
water	266.67	1,333.33	26.67	UNPRICED
oil	25.00	125.00	2.50	35.33

Revised input sum 1,702.50 g; ×5 sum 8,512.50 g. Known price subtotal 731.71 FCFA; unpriced inputs: milk, eggs, water. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: Butter interpreted as margarine; Omit improver: 120.00 g in the source batch; Omit Milk tantalizer: 20.00 g in the source batch; EDC interpreted as margarine. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; separate recipe oil, retained frying oil and fryer charge; current source mass is not edible yield; low listed water; identify other liquid contributions before mixing; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S143 / YUMMY BREAD / D5 onward; S143 / YUMMY BREAD / H5 onward. These repeated records are not independent trial evidence.

L252 YUMMY YOGHOURT (YUYO)

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-Y01–S-Y03. Similarity does not make the recipes equivalent.

Selected source record: S143, sheet “YUMMY YOGHOURT (YUYO)”, quantity column D. Source input sum 9,015.00 g; flour 0.00 g. Normalized basis 1,000 g original total input; after omissions the remaining total may be below 1,000 g.

Original ingredient	Source g	Source cell
Milk	1,000.00	'YUMMY YOGHOURT (YUYO)'!C5,D5
sugar	500.00	'YUMMY YOGHOURT (YUYO)'!C6,D6
Cold Water	7,000.00	'YUMMY YOGHOURT (YUYO)'!C7,D7
stock yoghort	500.00	'YUMMY YOGHOURT (YUYO)'!C8,D8
vanilla	15.00	'YUMMY YOGHOURT (YUYO)'!C9,D9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
milk	110.93	554.63	11.09	UNPRICED
sugar	55.46	277.32	5.55	35.50
cold water	776.48	3,882.42	77.65	UNPRICED
stock yoghort	55.46	277.32	5.55	UNPRICED
vanilla	1.66	8.32	0.17	UNPRICED

Revised input sum 1,000.00 g; ×5 sum 5,000.00 g. Known price subtotal 35.50 FCFA; unpriced inputs: milk, cold water, stock yoghort, vanilla. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: No ingredient identity or additive change required; normalize only.. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; stock yoghort requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S143 / YUMMY YOGHOURT (YUYO) / D5 onward; S143 / YUMMY YOGHOURT (YUYO) / F5 onward. These repeated records are not independent trial evidence.

L253 YUMMY YOGHOURT (YUYO)

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-Y01–S-Y03. Similarity does not make the recipes equivalent.

Selected source record: S143, sheet “YUMMY YOGHOURT (YUYO)”, quantity column H. Source input sum 42,525.05 g; flour 0.00 g. Normalized basis 1,000 g original total input; after omissions the remaining total may be below 1,000 g.

Original ingredient	Source g	Source cell
Milk	5,000.00	'YUMMY YOGHOURT (YUYO)'!C5,H5
sugar	2,500.00	'YUMMY YOGHOURT (YUYO)'!C6,H6
Cold Water	35,000.00	'YUMMY YOGHOURT (YUYO)'!C7,H7

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
milk	117.58	587.89	11.76	UNPRICED
sugar	58.79	293.94	5.88	37.62
cold water	823.04	4,115.22	82.30	UNPRICED
vanilla	0.59	2.95	0.06	UNPRICED

Revised input sum 1,000.00 g; ×5 sum 5,000.00 g. Known price subtotal 37.62 FCFA; unpriced inputs: milk, cold water, vanilla. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: No ingredient identity or additive change required; normalize only.. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S143 / YUMMY YOGHOURT (YUYO) / H5 onward. These repeated records are not independent trial evidence.

L254 YUMMY YOGHOURT (YUYO)

Status: preserved historical variant; owner-directed numerical revision only, **not a released production formula**. Closest working alternative: S-Y01–S-Y03. Similarity does not make the recipes equivalent.

Selected source record: S143, sheet “YUMMY YOGHOURT (YUYO)”, quantity column L. Source input sum 21,287.50 g; flour 0.00 g. Normalized basis 1,000 g original total input; after omissions the remaining total may be below 1,000 g.

Original ingredient	Source g	Source cell
Milk	2,500.00	'YUMMY YOGHOURT (YUYO)'!C5,L5
sugar	1,250.00	'YUMMY YOGHOURT (YUYO)'!C6,L6
Cold Water	17,500.00	'YUMMY YOGHOURT (YUYO)'!C7,L7
vanilla	37.50	'YUMMY YOGHOURT (YUYO)'!C9,L9

Revised ingredient	Pilot g	×5 g	% basis	Known FCFA
milk	117.44	587.20	11.74	UNPRICED
sugar	58.72	293.60	5.87	37.58
cold water	822.08	4,110.39	82.21	UNPRICED
vanilla	1.76	8.81	0.18	UNPRICED

Revised input sum 1,000.00 g; ×5 sum 5,000.00 g. Known price subtotal 37.58 FCFA; unpriced inputs: milk, cold water, vanilla. This excludes all unresolved operating expenses and cannot establish contribution.

Changes: No ingredient identity or additive change required; normalize only.. No lost additive mass is automatically replaced with flour or water. Removing an improver may change dough tolerance and keeping quality; measure rather than promising unchanged performance.

Outstanding: milk requires identity/specification; method, portion, losses and actual successful trial record not established by spreadsheet quantities alone.

Matching ratio occurrences: S143 / YUMMY YOGHOURT (YUYO) / L5 onward. These repeated records are not independent trial evidence.

Earlier handbook variants

The following original-formula summaries retain meaningful differences from the earlier generated handbooks. Source-local SRC numbers refer to S163's own source register. They are not this edition's S001–S179 identifiers. The instruction to remove improver overrides earlier suggestions to use it. These are research records, not instructions to add an improver.

V01 — Agege bread and tangzhong milk bread

Source SRC03/SRC04. Agege, flour basis: flour 100%; water 55–58%; sugar 10–12%; fat 8–10%; instant yeast 1.5–2%; salt 1.5%; improver 0.5% as an unverified original entry. Use the actual improver supplier dose, not the generic percentage. Original starting method: mix 3 minutes low, 8–10 minutes faster; proof to expansion; bake near 180°C for 25–30 minutes. Piece mass, tin size, dough temperature and finished yield are missing. Retain the dense, stretchy style as a separate trial from S-B02.

Shokupan original: tangzhong flour 7% plus liquid 35%; main dough flour 93%, milk 50%, sugar 10%, butter 10%, egg 10%, instant yeast 1.5%, salt 1.2%. The roux liquid plus main milk totals 85% of flour before egg if both are additional. It is unclear whether the 50% milk includes the roux liquid. Resolve this before mixing; do not silently reduce liquid or present the formula as verified. Baking, portion and pan specifications are also absent. Softness claims are not shelf-life evidence.

V02 — Specialist bread and pastry archive

These formula records come from SRC16 and the related SRC17/SRC19 drafts; SRC05/SRC14 later summarized them. Amounts below are original batch quantities unless percentages are stated. Butter, margarine and shortening are distinct ingredients requiring an explicit choice.

Product	Retained formula or distinctive variant	Development decision
Plain butter biscuits	Flour 18 kg; powdered sugar 7.2 kg; butter/margarine 9 kg; egg 1.8 kg; milk powder 540 g; vanilla 90 g	Distinct from S-P04 coconut biscuits. Confirm fat, portion, mixing and water activity; reject six-month life claim.
Croissant	Flour 18 kg; water/milk 9.9 kg with split unspecified; sugar 1.98 kg; dough butter 720 g; salt 360 g; yeast 270 g; roll-in butter 4.5 kg	Other drafts use 9.72 kg water, 900 g dough fat and different roll-in percentages. Select one formula; do not combine them. Confirm lamination equipment, fat plasticity and proof conditions.
Pain au chocolat	Croissant base; 10–12 g chocolate per pastry in one version; two batons in another	Define baton mass and dough weight. Pilot 4 mm sheet and 8 × 12 cm rectangles only after the base is fixed.
Pound cake	Flour 18 kg; sugar 18 kg; fat 18 kg; egg 16.2 kg; baking powder 270 g; salt 90 g; flavour 100 ml	Another draft has 18 kg egg and 360 g baking powder. Select a fixed version, edible egg mass, tin fill and mixing method; use a creaming-capable mixer.
Hard dough loaf	Flour 18 kg; water 8.64 kg; sugar 1.26 kg; shortening 1.08 kg; salt 360 g; instant yeast 108 g	Other versions differ materially in water, sugar and fat. Validate dense-dough load and moulder limits; do not force tight rollers.
Pain aux raisins	Croissant dough; 2.5 kg raisins per 18 kg flour; pastry cream unspecified	Incomplete: define cream recipe, quantity, treatment and chilled handling.

Product	Retained formula or distinctive variant	Development decision
Vendéenne-style braid	Flour 18 kg; sugar 3.24 kg; butter 4.5 kg; egg 5.4 kg; water 1.8 kg; salt 360 g; yeast 360 g	A 25%-butter variant, distinct from S-B06 50%-butter brioche. Regional naming needs care; validate cold fermentation and shaping.
Long sandwich roll	Flour 18 kg; water 10.8 kg; sugar 720 g; shortening 720 g; salt 360 g; instant yeast 144 g; malt 54 g	Define malt type and activity. Original 150 g dough piece is a pilot size, not final label mass.
Coconut crunch bread	Flour 18 kg; water 9.36 kg; sugar 2.7 kg; margarine 1.44 kg; coconut 1.8 kg; salt 270 g; yeast 180 g	Topping quantity absent; specify coconut moisture and topping before costing.
Whole-wheat loaf	Whole-wheat flour 9 kg + white flour 9 kg; water 11.7 kg; honey/molasses 900 g; oil 720 g; salt 360 g; yeast 126 g	Select honey or molasses. Optional oats/flax not quantified. Compare with V04's 60% whole-wheat formula.
Garlic-herb-cheese fougasse	Flour 18 kg; water 11.16 kg; oil 1.08 kg; garlic 90 g; herbs 54 g; salt 360 g; yeast 90 g	Garlic-oil and cheese topping amounts absent. Define yeast type and topping yield.
Laminated sausage roll	Flour 18 kg; lamination fat 9 kg; meat filling 15 kg	Pastry liquid, seasoning and binding missing. O-P08 is a complete shortcrust alternative, not an equivalent laminated formula.
Brownie	Sugar 14.4 kg; ambiguous "cocoa margarine" 9 kg; cocoa 3.6 kg; egg 7.2 kg; flour 5.4 kg; baking powder 54 g; vanilla 50 ml	Identify fat and tray depth; validate center set and cooled cut yield. Do not approve from surface colour alone.
Pain viennoise	Flour 18 kg; milk 9.9 kg; sugar 1.44 kg; butter 1.8 kg; salt 360 g; yeast 180 g; optional chocolate 1.8 kg	Distinct from S-B07 pain au lait. Cost and label the chocolate version separately.
Levain boule	Flour 18 kg; water 11.7 kg; levain 3.6 kg; salt 360 g; instant yeast 36 g	Levain hydration, flour contribution and maturity missing; total hydration cannot be established.
Vanilla gelato	Milk 12 kg; cream 3 kg; sugar 3 kg; skim powder 750 g; glucose/dextrose 300 g; vanilla 60 g; stabilizer 90 g	Ingredient types/solids and stabilizer unidentified. Prefer S-D02; do not assume a soft-serve machine is a batch freezer.
Pineapple-ginger pop	Juice 14 kg; water 3.5 kg; 65°Brix syrup 2 kg; ginger 450 g; lime 150 g	Fruit composition and treatment missing. S-I01 is the more specified trial.
Cocoa cream pop	Milk 11 kg; water 3 kg; cocoa 1.5 kg; sugar 3.5 kg; "cornstarch/stabilizer" 120 g; vanilla 30 ml	Starch and stabilizer are not interchangeable. Prefer S-I03 or develop a separate specified starch formula.
Cocoa-banana gelato	Milk 10 kg; banana 4 kg; cocoa 1.5 kg; sugar 2.2 kg; cream 2 kg (SRC15)	Determine fat/solids, fruit treatment, freezing behaviour, equipment and portions.

Baguette, Kumba, Pullman, burger buns, pain beurre and pain au lait from the same archive map to S-B01–S-B05 and S-B07. Their earlier ingredient ranges were development versions, not independent approved products. The exact original files remain identified in the source register; the complete S cards are the working specifications.

V03 — Additional September concepts

Source SRC05/SRC14. These additions retain ideas not fully covered by the later cards.

Product	Formula retained	What must be resolved
Cocoa-groundnut breakfast loaf	Bread flour 17.1 kg; roasted groundnut flour 900 g; cocoa 540 g; water or milk 10.8 kg; sugar 1.44 kg; oil 900 g; milk powder 540 g; salt 324 g; instant yeast 180 g; optional chocolate 1.8 kg	Select water or milk; test absorption, nut quality, allergens and portion yield. Initial 250–300 g dough, 190°C/18–22 minutes are trial starting points.
Chicken-vegetable pocket	Dough: flour 10 kg, water 5.5 kg, sugar 500 g, oil 400 g, salt 180 g, instant yeast 100 g. Filling: cooked chicken 5 kg, cabbage 1 kg, carrot 800 g, onion 800 g, oil 250 g, seasoning 100 g, breadcrumbs or cooked potato 500 g	Select binder and seasoning; quantify egg wash and cooked filling loss. Original assembly 60–70 g dough + 40 g filling; bake trial 195–205°C/15–18 minutes with verified core cooking.
Mango “ginger” soft serve	Milk 5.5 kg; cream 1.2 kg; sugar 1.4 kg; skim powder 600 g; dextrose/glucose 250 g; mango 1 kg; lime 50 g; stabilizer about 50 g	No ginger amount is supplied despite the name. Total is 10.25 kg before adjustments. Select dry sugar type and specified stabilizer; qualify treated fruit additions and machine compatibility.
Early bissap pop	Water 6.5 kg; infusion 1.5 kg; 65°Brix syrup 1.8 kg; ginger 150 g; lime 50 g; stabilizer 20–30 g	Syrup contributes only 1.17 kg sugar, so the original 18–22°Brix assertion is not supported by the listed sugars. Use S-I02 as the revised trial.
Shawarma baguette	Baguette 250 g; cooked chicken 80–100 g; fries 100–120 g; sauce 30 g; salad 30–40 g	A portion-range concept. Fix exact weights and costs using O-B18/O-B20/O-B22/O-B24 and S-B01 before sale.
Spring rolls	Cabbage 3 kg; carrot 1.2 kg; onion 700 g; optional cooked chicken/beef 2 kg; oil 250 g; garlic/ginger 120 g; seasoning/salt 120 g; optional breadcrumbs/cooked potato 350 g	Original target about 100 pieces, with 45–50 g filling each, purchased wrappers and 170–175°C frying trial. Define wrapper mass/count, split seasonings, sealing paste, absorbed oil and cooked filling yield; validate the center rather than relying on the original 3–4-minute time.
Focaccia slab; coconut nondairy frozen dessert; mango/passionfruit/banana fruit trio	Selection concepts without fully resolved formulas	Keep on the development list; do not imply a complete recipe was supplied. Rebalance fruit sugar/acid and coconut fat/solids separately.

V04 — October blueprint alternatives

Source SRC22; SRC23 is an exact duplicate. Values are original commercial batches. These preserve formula alternatives and new concepts without carrying over unsupported machine or life claims. Meat uses H01, dairy H02/H04 and fruit H03; no raw-meat massaging in the dairy tank.

Original product	Retained ingredients	Harmonized decision
Milk sandwich bread	Flour 50 kg; water 28 L; milk powder 2.5 kg; margarine 2 kg; sugar 3 kg; salt 900 g; yeast 600 g	Older milk-powder alternative to O-P01/S-B04; do not assume four-day life.

Original product	Retained ingredients	Harmonized decision
Hard-crust baguette	Flour 50 kg; water 31 L; salt 1 kg; yeast 500 g; ascorbic acid 10 g	Improver specification and supplier dose required; S-B01 is the clearer working card.
Chin-chin	Flour 25 kg; sugar 6 kg; margarine 5 kg; milk powder 1.5 kg; nutmeg/vanilla 200 g combined; eggs 30; water 5 L	Weigh eggs, split flavour quantities, specify dough thickness and fry endpoint. Three-month life unsupported.
Dual-leavened beignets	Flour 20 kg; sugar 4 kg; yeast 400 g; baking powder 150 g; salt 200 g; water 13 L; flavour 100 ml	Distinct from yeast puff-puff and cake beignets. Fix leavener types and test; no guarantee of hollow or oil-free texture.
Powder-milk yogurt	Full-cream powder 5 kg; water 22 L; sugar 2 kg; YF-L811 culture 5 g; flavour 50 ml	Culture units, supplier dose, total solids and working tank volume unresolved; do not inherit S-Y culture dosing.
Chicken marinade	Chicken 20 kg; yogurt 2 L; oil 1 L; garlic 500 g; spices 300 g; lemon 400 ml; salt 250 g	Weigh liquids and identify spices; marination is refrigerated and does not replace cooking.
Yogurt-mayo sauce	Mayonnaise 5.5 L; yogurt 3.5 L; garlic 500 g; lemon 250 ml; vinegar 100 ml; salt/pepper 55 g combined	SRC26 splits seasoning into 40 g salt + 15 g pepper and adds mint. Keep refrigerated; final mass/volume unmeasured.
Meat-pie filling	Beef 4 kg; potato 5 kg; carrot 3 kg; onion 2 kg; starch 500 g; “seasoning/water” 6 L	Seasoning versus water unresolved. O-B09 provides a complete alternative; no unsupported 40% saving claim.
Pie crust	Flour 15 kg; cold margarine 7.5 kg; salt 200 g; cold water 4.5 L	Distinct fat ratio from O-B07; validate short mixing and chilled handling.
Koki corn	Corn mash 15 kg; palm oil 1.5 L; pepper 100 g; salt 120 g; water 2 L	Specify corn solids, grinding, wrap size and validated steaming endpoint. Do not assume scraper aeration.
Ndjansang chilli sauce	Pepper 5 kg; onion 2 kg; toasted ndjansang 300 g; oil 2 L; garlic/ginger 500 g combined; salt/bouillon 200 g combined	Split all combined ingredients. Hot bottling and oil separation do not establish ambient safety.
Coconut tarts	Coconut 6 kg; sugar syrup 4 L; vanilla 50 ml; shortcrust shells 100	Specify syrup solids and shell mass/formula. Measure oven temperature throughout baking; residual heat is not automatically adequate.
Brioche poulet	Rich brioche dough 10 kg; cooked chicken filling 5 kg; egg wash 200 ml; sesame 50 g	Original assembly 80 g dough + 40 g filling gives 125 units before losses; define the dough/filling versions and actual yield.
Caramel topping	Sugar 10 kg; glucose 3 kg; water 4 L; cream 2 L; salt 30 g	The original 120°C caramelization claim is inadequate. Use a qualified controlled caramel method and appropriate vessel; dairy sauce is not automatically shelf-stable.

Original product	Retained ingredients	Harmonized decision
Sugar ring donuts	Flour 20 kg; sugar 3.5 kg; margarine 1.5 kg; yeast 350 g; water 9.5 L; nutmeg 100 g	Salt absent in original; resolve deliberate omission and formula before trial. Sugar coating unquantified.
Ganache rings	Donut rings 200; dark chocolate 4 kg; cream 3 L; butter 500 g	Define cream mass/fat, chocolate type, pickup and chilled handling. No all-day warm holding claim.
60% whole-wheat loaf	Whole-wheat flour 30 kg; white flour 20 kg; water 33 L; brown sugar 2 kg; margarine 1.5 kg; salt 900 g; yeast 600 g	Distinct from V02 50% version. Hydration is 66%; adjust by measured absorption, not an automatic extra 10%.
Avocado-banana cream	Avocado 8 kg; banana 4 kg; lime 200 ml; ascorbic acid 15 g; icing sugar 2 kg	Antibrowning ingredients do not confer shelf stability. Treat as perishable with a qualified process.
Savoury puff-puff	Flour 15 kg; leeks 1.5 kg; onions 1 kg; yeast 300 g; salt 250 g; water 10 L	Sauté/cool vegetables under control, define batter mass/portion and fry endpoint; cooking oil allowance absent.
Akara	Peeled black-eyed-bean mash 12 kg; onion 1.5 kg; salt 100 g; white pepper 30 g; water 1.5 L	Specify mash solids, milling and hydration; validate cooking and aeration with suitable equipment.

V05 — High-value recipe sheet differences

Source SRC20. These are alternative formulas, not automatic improvements to V04.

Product	Distinct original quantities	Gap or correction
Corn/makabo paste	Corn or grated makabo 15 kg; palm/vegetable oil 2.5 L; pepper 150 g; water 3 L; salt/bouillon 120 g	Corn and makabo are not interchangeable raw materials; makabo needs a separately established preparation/cooking process. Frying or baking cannot be assumed equivalent to steamed koki.
Chin-chin	Flour 12 kg; sugar 3.5 kg; margarine 2.5 kg; eggs 30; nutmeg 80 g; vanilla 100 ml; water about 2.5 L	Record edible egg mass and final hydration. Life requires water-activity, packaging and microbial assessment.
Brioche poulet	Flour 10 kg; fat 1.5 kg; sugar 1.2 kg; yeast 120 g; salt 150 g; cooked chicken filling 6 kg	Dough liquid/egg missing. Original 80 g dough + 30 g filling differs from V04; do not blend counts.
Drinking yogurt	Milk powder 4.5 kg; water 22 L; sugar 2.2 kg; starter/plain yogurt 500 g; gelatin/pectin 50 g	Starter alternatives and gelling agents are not interchangeable. Sugar/additive post-treatment introduction and chilling need redesign.
Vinegar chilli sauce	Pepper 4 kg; onion 2 kg; garlic 500 g; ndjansang 100 g; oil 1.5 L; vinegar 1 L; salt 80 g	Vinegar acidity, final pH and thermal process unspecified; refrigerate under approved process, not an ambient claim.
Sweet milk loaf	Flour 15 kg; milk powder 600 g; sugar 1.5 kg; yeast 150 g; improver 30 g; water 8.5 L; margarine 800 g	Salt missing. Improver label required. Extra softness is not validated life extension.

Product	Distinct original quantities	Gap or correction
Meat pie	Flour 10 kg; shortening 4.5 kg; beef 4 kg; carrot 2 kg; potato 2 kg; spices 150 g	Pastry water/salt and filling process loss omitted. Prefer O-P07 until completed.
Dual-leavened beignets	Flour 12 kg; sugar 2.8 kg; baking powder 100 g; yeast 80 g; vanilla 50 g; nutmeg 30 g; water 7.5 L	Compare with V04, with each leavener fixed and measurable. Salt omitted in original.
Caramel	Sugar 8 kg; water 2 L; glucose 1.5 kg; “cream/margarine” 2.5 L; salt 40 g	Cream and margarine are not interchangeable, and margarine volume is ambiguous. Use heat-safe equipment; adding dairy to caramel causes vigorous bubbling.
Avocado-banana cream	Avocado 10 kg; banana 4 kg; ascorbic acid 20 g; 65°Brix syrup 2 L; lime 300 ml	Weigh syrup and specify solids; original 48-hour colour claim is unverified and not a safety period.

V06 — Condensed-milk collection

Source SRC25. Preserve the condensed-milk concept while specifying brand composition, ingredient masses, treatment and machine compatibility. The primary O-series provides more complete trial formulations for most of these formats.

Product	Original batch or assembly	Decision
Soft-serve mix	Condensed milk 4.5 kg; milk 6 L; cream 3.5 L; water 6 L; sugar 1 kg; stabilizer 80 g; vanilla 60 ml	Weigh dairy; identify stabilizer and final solids. O-FBASE1 is the more specified trial.
Yogurt/frozen yogurt	Milk 12 L; condensed milk 5 kg; water 4 L; starter 200 g; vanilla 40 ml	Culture identity/dose and fermentation curve absent. Not automatically compatible with a soft-serve machine.
Milky pops	Condensed milk 6 kg; water 12 L; coconut milk or mango purée 3 L; cornstarch 350 g; salt 15 g	Coconut and mango are distinct variants; treatment and composition differ.
Pita	Flour 5 kg; water 2.8 L; sugar 120 g; salt 80 g; oil 150 ml; active dry yeast 60 g	Active dry yeast requires its own handling; not gram-for-gram instant yeast. Moulder flattening capability unverified.
Meat marinade	Meat 10 kg; yogurt 1.5 kg; garlic 250 g; vinegar 200 ml; oil 150 ml; salt 90 g; spice 150 g	Beef and chicken require separate specifications and cooking records.
Refrigerator pickle concept	Cucumber 5 kg; water 3 L; vinegar 2 L; sugar 250 g; salt 200 g; garlic 10 cloves	Vinegar acidity and garlic mass absent; sealed buckets are not an ambient preservation process. Use O-B23.
Ndjansang sauce	Pepper 2 kg; ndjansang 150 g; garlic 100 g; ginger 100 g; oil 1 L; salt 40 g	No acid control claimed. Treat as a refrigerated perishable sauce.
Condensed-milk burger buns	Flour 6 kg; condensed milk 800 g; water 2.8 L; butter 500 g; eggs 6; salt 90 g; instant yeast 80 g; sesame unspecified	Weigh egg and sesame/egg wash; use O-B25 as working alternative.
Smash burger	One bun, raw beef 120 g, cheese, sauce, pickles and onion	Toppings unquantified. Original 90-second cook is not a safety endpoint; follow O-P16/H01.

Product	Original batch or assembly	Decision
Pain chargé beef filling	Beef 4 kg; onion 2 kg; garlic/ginger 150 g; oil 300 ml; cabbage 3 kg; pepper/seasoning unspecified	Separate combined ingredients; weigh cooked output and portion.
Chips and pain chargé	Initial 140°C/5-minute fry, final 180°C/2–3-minute fry proposed; sandwich adds beef filling 150 g plus chips/sauce unspecified	Potato and plantain need separate trials. Use O-B24 for fries; define bread and all portions.
Condensed-milk sandwich loaf	Flour 10 kg; condensed milk 1.2 kg; water 5.4 L; shortening 400 g; salt 150 g; yeast 100 g	Working alternatives O-P01/O-P02; qualify pan load and finished mass.
Condensed-milk baguette	Flour 10 kg; condensed milk 300 g; water 5.8 L; salt 180 g; yeast 90 g	Distinct enriched bread, not S-B01 lean baguette.
Condensed-milk chin-chin	Flour 8 kg; margarine 1.5 kg; condensed milk 2 kg; eggs 12; nutmeg 40 g; frying oil unspecified	Edible egg, hydration, oil use and finished yield unresolved.
Condensed-milk puff-puff	Flour 5 kg; condensed milk 800 g; water 3.2 L; sugar 400 g; yeast 60 g	Trial sweetness/proof/fry behaviour; “oil-free” claim rejected.
Koki corn	Corn mash 10 kg; palm oil 1.2 L; pepper 50 g; water 1.5 L; salt 80 g	Specify steaming and mash consistency; a scraper does not guarantee aeration.
Condensed-milk caramel	Sugar 4 kg; condensed milk 2 kg; glucose 1.5 kg; water 1 L; butter 250 g	Qualify vessel, heat range, controlled dairy addition, chilling and life; no ambient claim.
Coconut pastry slices	Coconut 2 kg + condensed milk 1.5 kg; pastry sheets unspecified	Specify sheet formula, mass, pan depth and measured bake program.

V07 — Garlic sauce variants

Source SRC26. Toum original: peeled garlic 1.5 kg, oil 8 L, lemon juice 450 ml, water 250 ml, salt 70 g. Claimed 10 L yield is unmeasured; weigh inputs, specify oil, blend/emulsify using suitable equipment and determine usable output. A slow scraper is not assumed to make this emulsion. Garlic-in-oil sauce is a perishable product; no ambient storage is authorized.

Yogurt-mayo original: commercial mayonnaise 5.5 L, yogurt 3.5 L, garlic 500 g, lemon 250 ml, vinegar 100 ml, salt 40 g, white pepper 15 g and optional mint 2 tablespoons. Weigh ingredients and mint; verify the mayonnaise and yogurt supply specifications. Keep the cold preparation and service controlled. O-B20 and S-F04 offer smaller fully quantified alternatives with different flavour profiles.

V08 — Brioche format options retained

SRC05’s extended brioche uses the same 50%-butter base concept as S-B06 and adds useful alternative shapes. A 5 kg flour batch has 11,450 g raw dough; at an assumed 2% handling loss, 11,221 g remains. Alternative allocations are 187 × 60 g with 1 g remainder, 140 × 80 g with 21 g remainder, 37 × 300 g with 121 g remainder, or 22 × 500 g with 221 g remainder. These are alternatives, not simultaneous outputs.

For a 500 g loaf, arrange five 100 g balls; for a three-strand braid, use 167 + 167 + 166 g. A brioche à tête may reserve about one fifth for its head. Trial small pieces at 170–180°C for 14–20 minutes, 300 g loaves at 165–175°C for 22–30 minutes, and 500 g loaves at 165–175°C for 30–40 minutes. Confirm crumb set and measured bake loss; the 90–94°C crumb target is a quality check, not a substitute for a validated food-safety process. Raw egg wash is applied only before baking.

Cool plain brioche completely before bagging. A frozen-quality trial at −18°C may compare two- and four-week samples; this does not establish a selling period or validate freezing raw dough. Keep butter, egg wash, refrigeration, rejects and unsold portions in the cost model.

H2 companion: historical recipe content carried forward from H1. For the corrected baguette programme use BAG-H2-01 and PLAN-BAG-P/N/H in the operating volume.

Harmonized working edition H2 • 8 October 2026

This volume preserves additional source recipes, components and recipe-bearing pages for development. R entries are reference records, not a count of unique saleable products. Some contain several related variants, and different sources may describe the same product. The working booklet identifies the recipes selected for controlled trials.

Do not produce directly from an unreviewed archive entry. Original quantities and methods are retained as comparison evidence. They may contain household measures, OCR errors, unverified doses, unsafe shortcuts or unsupported storage claims. C01–C05 in the working booklet supersede conflicting safety advice. The entry's issue note identifies the required next action. No historical price, yield claim, nutrition claim or shelf-life claim is adopted as a verified fact.

R001 VANILLA ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 75–78.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

VANILLA ICE CREAM Makes about 1 quart It always makes us happy when people get a scoop of our vanilla ice cream. Sure, it may not be quite as exciting as some of our other flavors, but to us vanilla is the true litmus test of a great ice cream maker. Vanilla gives you a pure sense of the quality of ingredients— not just of the vanilla itself, but also of the dairy products and eggs— as well as the skill of the ice cream maker. We use two kinds of vanilla in this recipe, both vanilla bean and pure extract, for an intense vanilla flavor. This ice cream is the ideal canvas for any type of mix-ins you want to use, from chopped nuts, cookies, or candies to swirled-in sauces. Or keep it simple and enjoy the pure floral vanilla flavor! AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 30 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ teaspoon kosher salt 1 vanilla bean 5 large egg yolks 2 teaspoons pure vanilla extract INFUSE THE MILK/CREAM

1. In a heavy nonreactive saucepan, stir together the cream, milk, half of the sugar (¼ cup), and the salt. Split the vanilla bean lengthwise and use the knife to carefully scrape the seeds from the bean. Add the seeds and the split bean to the pan. 2. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat, cover the pan, and let steep for about 30 minutes. MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (¼ cup) until smooth. Set aside. 4. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the egg yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula or wooden spoon, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and stir occasionally until the base is cool. Remove from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM

8. Add the vanilla extract to the base and stir until blended. 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH …

R002 BUTTERMILK ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 79–80.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BUTTERMILK ICE CREAM Makes about 1 quart We think of this flavor as old-fashioned—in the best way possible. It evokes an earlier time, when butter was churned at home by hand. Buttermilk's tart-rich flavor enhances any kind of fruit. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar 1½ cups heavy cream ½ cup 1% or 2% milk 1 cup buttermilk 1 teaspoon pure vanilla extract MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, and the remaining sugar (6 tablespoons) and put the pan over medium- high heat. When the mixture approaches a bare simmer, reduce the heat to medium.

3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. (The base must be completely cold, otherwise the buttermilk will cause the mixture to "break" and lose its emulsion.) FREEZE THE ICE CREAM 6. Add the buttermilk and vanilla to the cold base and whisk to blend. 7. Freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH …

R003 CRÈME FRAÎCHE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 81–84.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CRÈME FRAÎCHE ICE CREAM Makes about 1 quart |

Pictured here This luscious ice cream pairs well with many flavors, since the natural tanginess of crème fraîche offers a perfect neutral background for fruit. We make this in the late spring and early summer because it is such a perfect pairing for the strawberries, cherries, and other fruits that come in around that time. We have one guest, James, who stocks up on quarts of it when we approach the end of our run! We prefer to make our own crème fraîche. It takes just a minute to mix the ingredients, then a day later they're cultured—and taste so good! This recipe makes a little more than you need to make the ice cream; use any leftovers slathered onto scones or even swirled into puréed soups. You could, of course, use store-bought crème fraîche if you don't have time to make it yourself. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine WAITING AND CHILLING TIME: 24 to 48 hours for the crème fraîche, 2 hours or overnight for the ice cream base SHELF LIFE: 1 week FOR THE CRÈME FRAÎCHE 1 cup heavy cream 3 tablespoons buttermilk FOR THE ICE CREAM

4 large egg yolks ¾ cup sugar 1 cup heavy cream 1 cup 1% or 2% milk ¼ teaspoon kosher salt 1 cup crème fraîche 2 tablespoons strained fresh lemon juice MAKE THE CRÈME FRAÎCHE 1. In a small bowl, mix the cream and buttermilk. Cover and let stand at room temperature for 24 to 48 hours, or until the consistency of sour cream. Then refrigerate until needed; the crème fraîche will become even thicker as it cools down.

TIP:

The warmer your kitchen, the faster the crème fraîche will thicken. If you aren't sure how long it will take, or if it's your first time making it, allot the full 48 hours just in case. If it takes less time than that to thicken, you can store it in the fridge for a few days until you're ready to use it. MAKE THE BASE 2. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Set aside. 3. In a heavy nonreactive saucepan, combine the cream, milk, salt, and the remaining sugar (6 tablespoons) and put the pan over medium- high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 4. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl

with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 5. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 6. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. (In this recipe, it's particularly important that the base is cold before proceeding to the next step, because otherwise the crème fraîche will cause the mixture to "break" and lose its emulsion.) FREEZE THE ICE CREAM 7. Add the crème fraîche and lemon juice to the cold base and whisk to blend. 8. Freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH … • Blood Orange Sorbet , one of Anne's favorite combinations • Balsamic Strawberry Ice Cream and Sliced Strawberry Topping • Chocolate Ice Cream • Lemon Gingersnaps

R004 CHEESECAKE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 85–87.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

Ice cream pie with Cheesecake Ice Cream , Brown Sugar Graham Cracker piecrust , and fresh blueberries CHEESECAKE ICE CREAM Makes about 1½ quarts Whereas the buttermilk and crème fraîche ice creams are light and delicate, this one packs a rich, creamy wallop. This recipe is made for add-in ingredients to create a full-on cheesecake effect: see Make It Your Own for ideas.

Plain cream cheese, like Philadelphia brand, is the classic choice for making this recipe; in fact, the stabilizers in this product will help keep the base emulsified. Natural cream cheese will give you a lighter flavor. Or use mascarpone for a rich flavor without the tang of cream cheese. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar 1½ cups heavy cream 1½ cups 1% or 2% milk 8 ounces cream cheese, at room temperature 1 tablespoon strained fresh lemon juice 1 teaspoon pure vanilla extract MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Put the cream cheese in another medium heatproof bowl. Set both bowls aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, and the remaining sugar (6 tablespoons) and put the pan over medium- high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the

saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into the bowl with the cream cheese. Whisk until smooth, then set the bowl into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. (In this recipe, it’s particularly important that the base is cold before proceeding to the next step, because otherwise the lemon juice will cause the mixture to “break” and lose its emulsion.) FREEZE THE ICE CREAM 6. Add the lemon juice and vanilla to the cold base and whisk to incorporate well. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

R005 GREAT YELLOW CAKE

Reference formulation — not released for production. Source S129, PDF pages 88–90.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

Great Yellow Cake , as cupcakes GREAT YELLOW CAKE Makes two 8-inch round cakes (enough for 2 ice cream cakes) or about 24 cupcakes We use this as a base for many of our ice cream cakes, and it gets its name because it is so versatile. Our favorite combination? Soak the cake with some caramel sauce and top with a layer each of Brown Butter Pecan Ice Cream and Malted Vanilla Ice Cream with Peanut Brittle and Milk Chocolate Pieces . Divine!

You can also skip the ice cream altogether and use this recipe to make a traditional layer cake for a birthday or any other celebration. Or bake the batter into cupcakes and top with buttercream frosting. AT A GLANCE SPECIAL EQUIPMENT: Two round cake pans, each 8 inches in diameter and 2 inches deep, or two standard muffin pans COOLING TIME: At least 1 hour SHELF LIFE: 5 days Nonstick cooking spray or unsalted butter, for the pans ¾ cup canola oil ½ cup water ⅓ cup apple juice 2 cups (9 ounces) unbleached all-purpose flour 1 tablespoon baking powder ½ teaspoon kosher salt 1½ cups sugar 4 large eggs ¼ teaspoon pure vanilla extract 1. Position a rack in the center of the oven if making cakes; if making cupcakes, position racks in the top and bottom thirds of the oven. Preheat the oven to 350°F. If making cakes, spray or butter two round cake pans, each 8 inches in diameter and 2 inches deep, and line the bottoms with parchment; if making cupcakes, line two standard muffin pans with paper or foil liners. 2. In a liquid measuring cup, mix the oil, water, and apple juice and set aside. In a medium bowl, whisk together the flour, baking powder, and salt and set that aside as well. 3. In the bowl of a stand mixer with the whisk attachment, combine the sugar, eggs, and vanilla. Whip on medium-high speed until the

mixture is thick, has tripled in volume, and makes a fat ribbon that holds its shape for a few seconds on top of the batter when you lift the whisk, about 4 minutes. 4. With the motor running on medium speed, add the liquid in a slow, steady stream. (The trick here is to incorporate and emulsify the liquid into the eggs without causing the eggs to deflate. Adding the liquid slowly in a constant stream is the name of the game.) 5. Add the dry ingredients to the egg mixture and mix on low speed just until the batter is smooth and lump-free, about 30 seconds. (Be careful not to overbeat, which will make the cake tough.) 6. Divide the batter between the cake pans or among the muffin cups. Bake until the cakes are golden, spring back to a light touch, and a toothpick inserted into the center comes out clean, about 35 minutes for cake and about 20 minutes for cupcakes. 7. Let the cakes cool in the pans for 40 minutes, then invert onto a wire rack. Remove the parchment and let cool completely. Let the cupcakes cool in the pans for 20 minutes before transferring onto a wire rack, then let cool completely.

R006 SHORTBREAD

Reference formulation — not released for production. Source S129, PDF pages 91–94.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SHORTBREAD Makes about 28 two-inch cookies, or one 9-or 10-inch tart crust, or 4 cups of crumbs |

Pictured as piecrust This recipe is easy to follow, and mixing the dough takes no time at all. You can use it to make buttery, crumbly cookies to serve with ice cream or a tart crust, which is especially good filled with lemon curd, whipped cream, or pastry cream, and topped with fresh fruit. This shortbread can also be used to make a Cookie Crumb Piecrust for an ice cream pie. AT A GLANCE CHILLING TIME: 2 hours or up to overnight if making cookies or tart crust SHELF LIFE: 5 days for cookies and crust, 1 week for crumbs 1 cup (8 ounces) cold unsalted butter, cut into ½-inch cubes 2 cups (9 ounces) unbleached all-purpose flour, plus more for dusting ½ cup powdered sugar, measured then sifted ½ teaspoon kosher salt MAKE THE DOUGH 1. Combine all of the ingredients in the bowl of a stand mixer with the paddle attachment. Mix on low speed at first, and then increase to medium-low speed and continue mixing until the dough is smooth and just comes together in a solid mass, 1½ to 2 minutes. TO MAKE COOKIES 2. Turn the dough out onto a piece of plastic wrap and shape into a disk 1 inch thick. Wrap in the plastic wrap and refrigerate until firm, 1 to 2

hours or up to overnight. 3. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 4. On a lightly floured surface, roll the dough to a ¼-inch thickness (or slightly thicker or thinner, if you like). Using a cookie cutter (or a knife for free-form shapes), cut out cookies from the dough. If you use a cutter, gather and reroll the scraps up to two more times; any more than that and the cookies will become tough. 5. Arrange the cookies at least ¾ inch apart on the baking sheets and bake for 8 minutes. Rotate the sheets top to bottom and front to back and continue to bake until lightly browned around the edges, 4 to 6 minutes longer. 6. Let cool on the baking sheets for 5 minutes, then gently transfer to a rack (the cookies are very delicate when warm, but will become slightly sturdier as they cool). Let cool completely. Store in an airtight container. TO MAKE A TART CRUST 2. Turn the dough out onto a piece of plastic wrap and shape into a disk 1 inch thick. Wrap in the plastic wrap and refrigerate until firm, 1 to 2 hours or up to overnight. 3. When you’re ready to bake, position a rack in the center of the oven and preheat the oven to 350°F. 4. On a lightly floured surface, roll the dough to a ¼-inch thickness. Transfer to a tart pan 9 or 10 inches in diameter either by rolling the dough loosely around the rolling pin and unrolling over the pan, or by sliding the removable tart pan bottom under the dough and using it to transfer the dough into the pan. Being careful not to press or stretch the dough, gently ease the dough into the corners of the pan. Remove the excess dough along the top edge of the pan using a small knife or

your fingers. Prick the bottom of the dough with a fork at 1-inch intervals. 5. Bake until the crust is light golden and looks dry in the center, about 20 minutes. When you take it out of the oven, gently press down on any air bubbles that may have formed. Let cool completely on a rack. TO MAKE CRUMBS FOR AN ICE CREAM PIE 2. Position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 3. Break the dough into walnut-sized lumps with your fingers and space them evenly on the baking sheets. Bake for 10 minutes, then rotate the pans front to back and top to bottom. Continue to bake for another 10 to 15 minutes, or until the pieces are golden brown and give just slightly to the touch. 4. Let cool completely on the baking sheets. Working in batches as necessary, transfer the shortbread to a food processor and pulse until it becomes a coarse meal. Store in an airtight container for up to a week at room temperature; freeze for longer storage.

R007 SUGAR CONES BOWLS

Reference formulation — not released for production. Source S129, PDF pages 95–97.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SUGAR CONES or BOWLS Makes about 15 cones or bowls These crispy, delicious cones taste better than anything you can buy. Best of all, you don’t need a special machine to make your own sugar cones. All you need is a mold to shape the cones on, which you can easily make on your own (instructions follow this recipe), and a nonstick mat. A small offset spatula is essential for spreading the batter as thinly as possible (the cones won’t be crunchy if the batter is too thick). These cones are best eaten the same day they are made. AT A GLANCE SPECIAL EQUIPMENT: Nonstick baking mat, a small offset spatula, and the mold of your choice (a metal or wooden cone shaper, a homemade shaper, or a teacup) SHELF LIFE: 1 day 1¼ cups (6 ounces) powdered sugar, measured then sifted ½ cup egg whites (from about 4 large eggs) ¾ cup plus 2 tablespoons (4 ounces) unbleached all-purpose flour ½ cup (4 ounces) unsalted butter, melted 1. Position a rack in the center of the oven and preheat the oven to 350°F. Line a baking sheet with a nonstick mat. 2. Combine the powdered sugar and egg whites in a medium mixing bowl and whisk together. Add the flour, mix to blend, and add the melted butter. Mix again until blended and smooth. 3. Put a scant 2 tablespoons of batter in one corner of the nonstick mat and use a small offset spatula to spread the batter to a thin circle 5 inches in diameter. Try to spread the batter thinly and evenly for

maximum crispiness. Repeat up to three more times, as the baking sheet allows. You can place them fairly close together, since they don’t spread when baking, but you shouldn’t bake more than four at a time, because otherwise the baked circles will harden before you’re able to shape them all. 4. Bake for 6 to 7 minutes, rotating the pan during the last few minutes to help the cones brown evenly, until the edges of the batter are golden brown. Meanwhile, wash and dry the spatula. TO MAKE CONES 5. As soon as the baking sheet comes out of the oven, use the offset spatula to lift one of the circles and place it upside down on a work surface. Center the cone mold on the circle with the point about ¼ inch in from one edge. Quickly lift one side of the cookie, wrap it around the form, and repeat with the other side. (Use light fingers because the circle will be hot!) Gently pinch the point to close the end. Let the cone sit on the mold for a few seconds, then gently slide it off and repeat with the remaining circles. If one of the circles starts to firm up before you can form it, put the pan back in the oven for 30 seconds to reheat and soften it. TO MAKE BOWLS 5. Set a teacup upside down on the counter. As soon as the cookie sheet comes out of the oven, place a warm cookie over the cup. Use your hands to gently press the cookie down toward the sides of the teacup. Let cool for a second and repeat with the remaining circles. MAKE IT YOUR OWN

• Whisk 2 tablespoons finely grated lemon or orange

zest into the flour before you stir it into the batter.

R008 VANILLA BUTTERSCOTCH SAUCE

Reference formulation — not released for production. Source S129, PDF pages 98–100.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

VANILLA BUTTERSCOTCH SAUCE Makes about 1½ cups Butterscotch is a variation on a caramel sauce; it starts with a fairly light caramel for a delicate toasty base, and then it's enriched with the addition of butter. This sauce is irresistible drizzled over a couple of scoops of ice cream, or nibbled right off the spoon. Serve it warm, when it's thick and pourable; it takes on a pleasant, slightly chewy consistency when it comes in contact with cold ice cream. AT A GLANCE TECHNIQUE: Variation on caramel SHELF LIFE: 2 weeks (or longer!) ½ cup heavy cream, at room temperature ½ vanilla bean ½ cup water ¼ teaspoon cream of tartar 1½ cups sugar ¼ cup (2 ounces) unsalted butter, cut into ½-inch slices Pinch of kosher salt 1. Set the cream by the stove so it's at hand when you need it. 2. Split the vanilla bean lengthwise and use the knife to carefully scrape the seeds from the pod. Put the seeds and the split pod in a medium nonreactive saucepan. Add the water and cream of tartar to the pan and carefully pour the sugar into the center of the bottom of the pan. Do not stir. 3. Put the pan over medium-high heat. At this point you must watch the

sugar constantly because once the caramelization begins the mixture can burn in a matter of moments! Cook without stirring until the sugar begins to brown in spots, 8 to 11 minutes. Gently swirl the pan once to evenly distribute the contents. 4. When the caramel is a light amber color (just a little darker than honey), about 5 minutes longer, remove the pan from the heat and immediately but slowly pour the cream into the pan. (The mixture will steam and bubble up, so wear oven mitts and be very careful to avoid splatters and steam burns.) When the bubbling subsides, gently stir to completely blend the cream into the caramel, scraping the vanilla bean seeds from the sides of the pan back into the sauce. If you have lumps of hardened caramel in your pan, put the pan over low heat and stir until the caramel is melted. 5. With a fork, carefully remove the vanilla pod from the sauce (it will be very hot!). Add the butter and salt and stir gently to blend. Let cool until just warm. If not using within a few hours, transfer to a container and refrigerate. Rewarm before using. MAKE IT YOUR OWN

• Make it boozy! Add a couple of tablespoons of

scotch or bourbon along with the butter and salt. (We've dubbed this spiked version "Boozerscotch"!)

Vanilla Buttercream Frosting

R009 VANILLA BUTTERCREAM FROSTING

Reference formulation — not released for production. Source S129, PDF pages 101–102.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

VANILLA BUTTERCREAM FROSTING Makes 4 cups (enough to frost a two-layer 8-inch cake, 24 cupcakes, or 2 or 3 ice cream cakes) There are many different types of buttercream out there, but we like this one best. It’s an old-fashioned version, made simply by combining the ingredients in a mixer and whipping until light and fluffy. It’s not as fussy as other buttercream recipes and is more stable. This recipe can easily be halved. AT A GLANCE SHELF LIFE: Up to 2 weeks ½ vanilla bean 4½ cups (1½ pounds) powdered sugar, measured then sifted 2 cups (1 pound) unsalted butter, at warm room temperature and cut into ½-inch slices 1 tablespoon pure vanilla extract ½ teaspoon kosher salt 1. Split the vanilla bean lengthwise and use the same knife to carefully scrape the seeds from the pod. Add the vanilla seeds and pod to the bowl of a stand mixer. Add the remaining ingredients to the mixing bowl and fit the mixer with the paddle attachment. 2. Beat first on low speed, and then increase to medium-high speed and continue to beat until the frosting is light, fluffy, and smooth, 2 to 3 minutes. Scrape the sides of the bowl and mix briefly again.

3. Remove the vanilla bean. Use the frosting immediately or cover and refrigerate for up to 2 weeks. If made ahead, let the frosting come to room temperature before using and remix briefly using the stand mixer until it regains its light and fluffy consistency. MAKE IT YOUR OWN

• For cinnamon buttercream, add 1 tablespoon

ground cinnamon.

• Fold in finely chopped peanut brittle, toffee, or

chocolate.

R010 MERINGUE

Reference formulation — not released for production. Source S129, PDF pages 103–105.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MERINGUE Makes about 3½ cups (enough to cover two 8-inch cakes) |

Pictured here This quick-to-make meringue is a lovely finish to ice cream cakes and pies, plus it holds up in the freezer beautifully after you've assembled the dessert. Whenever we have leftover meringue, we use it to make a s'more sundae. We combine chocolate ice cream with our housemade graham crackers and caramel sauce, then we top it with meringue and toast it with our propane torch. You can also use this meringue to top lemon curd tarts or pies. If you don't have a kitchen torch, you can toast the meringue in your oven under the broiler. You must keep a close eye on it though, because it burns easily and the ice cream will quickly start to melt! AT A GLANCE SPECIAL EQUIPMENT: Propane or butane kitchen torch (not essential but very helpful) SHELF LIFE: None; use immediately! ½ cup egg whites (from about 4 large eggs) 1 cup sugar ⅛ teaspoon kosher salt WARM THE EGG WHITES AND SUGAR 1. Put about 2 inches of water in the bottom of a medium saucepan and bring to a simmer over medium-high heat. If you are using a

gas stove, make sure the flames are not coming up around the pan, which will cause the egg whites to scorch. 2. In the bowl of a stand mixer, whisk together the egg whites, sugar, and salt just until combined. Place the bowl over but not touching the simmering water. Whisk the whites occasionally until they are just warm to the touch and the sugar is completely dissolved (you should not be able to feel granules), about 3 minutes. WHIP THE MERINGUE 3. Place the bowl on the mixer fitted with the whisk attachment and whisk on medium speed until the whites are glossy and hold their shape, 4 to 5 minutes. (To test if they are ready, with the mixer off, dip your finger in the meringue and then remove it. When you pull up, the meringue should hold its shape in a soft peak that curves downward at the top.) DECORATE 4. Working quickly, spread the meringue over the top of the cake or pie you are decorating. Use the back of a spatula to create swirls and swoops in the meringue. Toast the meringue with a torch or under the broiler for a few seconds, just until the surface is lightly toasted.

TIP:

Any type of oil or fat can hinder your whites from whipping up, so make sure your egg whites have no traces of yolk in them, and make sure your mixing bowl and whisk are spotlessly clean as well.

Whipped Cream

R011 WHIPPED CREAM

Reference formulation — not released for production. Source S129, PDF pages 106–107.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

WHIPPED CREAM Makes about 2 cups (enough for 6 to 8 sundaes) Homemade whipped cream is vastly preferable to anything you buy at the store. The homemade kind actually tastes like cream, and you have control over how sweet it will be. Once you whip the cream, it will hold for up to 8 hours in the refrigerator. It will separate as it sits, so rewhip the cream briefly just before using. AT A GLANCE SHELF LIFE: 1 day 1 cup heavy cream 2 tablespoons sugar 1 teaspoon pure vanilla extract Combine all of the ingredients in the bowl of a stand mixer and refrigerate for at least 15 minutes. (Doing this helps the cream whip faster.) Fit the bowl onto the mixer with the whisk attachment and whisk on medium-high speed until the cream is light and fluffy and holds a medium to firm peak when you lift the whisk out of the bowl, 2 to 3 minutes.

TIP:

Be careful not to overwhip the cream or its fat will start to coagulate into butter! It helps to reduce the mixer speed to medium as the cream approaches the desired consistency, thus slowing down the process and giving you a bigger

window in which to pull the plug.

TIP:

You can use half a vanilla bean instead of the vanilla extract. Split the bean lengthwise, scrape the seeds from the pod, and add the pod and seeds to the mixing bowl along with the cream and sugar. Remove the vanilla pod before using the whipped cream.

R012 MARSHMALLOWS

Reference formulation — not released for production. Source S129, PDF pages 108–114.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MARSHMALLOWS Makes about 4 dozen 1½-inch marshmallows This recipe requires a bit of time and attention, but it’s all worth it to have homemade marshmallows. Our version uses simple, straightforward ingredients, including real vanilla and egg whites (most commercial marshmallows no longer contain them). This is the perfect place to showcase the nuanced flavors of a vanilla bean. Timing is of the essence in this recipe, so it’s critical to have all of the ingredients and equipment set out and ready at the start. A candy thermometer is also essential. Use these marshmallows to make rocky road ice cream, float them on your hot chocolate, or mix them into fudge. AT A GLANCE SPECIAL EQUIPMENT: Candy thermometer and offset spatula COOLING TIME: Overnight, plus an additional hour as needed SHELF LIFE: 2 weeks Nonstick cooking spray, for the pan About ½ cup powdered sugar, measured then sifted, for dusting About ½ cup cornstarch, measured then sifted, for dusting ½ cup egg whites (from about 4 large eggs) 2 envelopes (¼ ounce each) unflavored powdered gelatin 6 tablespoons water, plus more as needed 1¼ cups granulated sugar 2 teaspoons pure vanilla extract or seeds from ½ vanilla bean GET READY 1. Spray a 9 by 13-inch baking pan with nonstick cooking spray and line it with parchment paper so that you have 1 inch of overhang on each long side of the pan. (The spray will help keep the parchment

in place.) In a small bowl, mix the powdered sugar and cornstarch. Sift about 4 tablespoons of the powdered sugar–cornstarch mixture over the bottom of the pan and set aside. 2. Put the egg whites in the bowl of a stand mixer with the whisk attachment; you’ll come back to it in a few minutes. 3. Put the gelatin in a shallow bowl and sprinkle 3 tablespoons of the water over it. Make sure the gelatin is completely saturated, adding a bit more water if necessary and using your fingers to gently mix it if needed. It will quickly thicken and become gummy and translucent. MAKE THE SYRUP AND WHIP THE WHITES 4. In a small heavy saucepan, mix the granulated sugar with the remaining 3 tablespoons water; the texture should be similar to wet sand. Use water-dipped fingers or a wet pastry brush to wash down the sides of the pan (this will help prevent the sugar from crystallizing) and attach a candy thermometer to the pan. 5. Put the pan over medium heat and cook, without stirring, until the mixture reaches 210°F, about 4 minutes. At this point let the syrup continue to cook over medium heat while you turn to the egg whites. 6. Whisk the egg whites on medium-high speed until they just form soft peaks, about 1½ minutes. When you lift the whisk out of the whites, they should hold their shape in a peak that droops over at the top.

TIP:

Egg whites can overwhip quickly, going from perfect peaks to grainy and unpleasant in an instant. If you’re new to whipping whites, go on medium speed to slow down the process, making it easier to know when to say when. 7. Once the whites reach soft peaks, reduce the speed to low and let

them continue to mix as you return your attention to the syrup on the stove. 8. When the syrup reaches 238°F, also known as the “soft ball” stage, about 6 minutes total, remove the pan from the heat. Stir in the gelatin and the vanilla extract or seeds, making sure the gelatin is completely dissolved. 9. Increase the mixer speed to medium-high and slowly add the syrup to the whipping whites; the best way to avoid spattering is to pour it slowly down one side of the bowl. If some of the syrup does splatter or stick to the sides, just leave it; don’t try to scrape it down. Continue to whip until the mixture has cooled somewhat (the bowl will still feel warm), 5 to 7 minutes longer. SPREADING THE MARSHMALLOWS 10. Transfer the still-warm mixture to the prepared pan and spread evenly using an offset spatula. Sift about 4 tablespoons more powdered sugar–cornstarch mixture over the entire surface of the marshmallows. Let dry uncovered at room temperature overnight.

TIP:

Try to avoid dislodging the powdered sugar–cornstarch mixture on the bottom of the pan as you spread it around. 11. The next day, invert the marshmallows onto a cutting board (gently pull on the overhanging parchment if the marshmallows don’t immediately release from the pan). Peel off the parchment. Sift another 4 tablespoons powdered sugar–cornstarch mixture over the surface that was previously in contact with the parchment; if it seems tacky, let air dry for another hour or so before proceeding. 12. Using kitchen shears or a knife, cut the marshmallows into pieces of whatever size you desire. If the knife or scissors become sticky, dip in the powdered sugar–cornstarch mixture between slices or spray with nonstick cooking spray, which makes the job much

easier. 13. Roll the marshmallows in more powdered sugar–cornstarch mixture, if you like. Store between layers of parchment in an airtight container. MAKE IT YOUR OWN

• Use ¼ teaspoon peppermint extract in place of

the vanilla extract or seeds. This variation is especially good in hot chocolate!

CARAMEL SALTED CARAMEL ICE CREAM

BROWN SUGAR ICE CREAM WITH A GINGER-CARAMEL SWIRL

BROWN SUGAR GRAHAM CRACKERS

ALMOND TOFFEE

TOFFEE CHIP COOKIES

CARAMEL SAUCE

R013 SALTED CARAMEL ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 123–126.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SALTED CARAMEL ICE CREAM Makes about 1 quart This flavor was a hit from the day we opened our doors, and it continues to be one of our most popular flavors. Every week we make about 135 pounds of caramel just for this ice cream. Although salt and caramel might sound like a strange combination, it actually works marvelously: the slight bitterness of the dark caramel pulls your tastebuds in one direction while the salt pushes them in another, and the sweet cream rounds everything out. It's a wallop of flavor, and incredibly addictive. AT A GLANCE TECHNIQUES:

Ice cream , Caramel SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours, or overnight SHELF LIFE: 1 week 1¾ cups heavy cream, at room temperature ¾ cup granulated sugar ¾ cup 1% or 2% milk 1 teaspoon kosher salt 5 large egg yolks MAKE THE CARAMEL 1. Set the cream by the stove so it's at hand when you need it. Measure out ½ cup of the sugar and set near the stove; you'll use this for the caramel (the rest will go in with the yolks). Put 2 tablespoons of the sugar for the caramel in a heavy nonreactive saucepan and put the pan over medium-high heat. When the sugar is melted around the edges and starts to turn amber in places (about 2 minutes), stir the

mixture gently and add another 2 tablespoons sugar to the pan. 2. Continue to add what remains of the ½ cup of sugar 2 tablespoons at a time, stirring frequently and allowing most of the sugar to melt before you add more. Watch carefully as the sugar darkens, stirring gently to help it melt evenly. 3. When the caramel becomes a dark mahogany color, remove the pan from the heat and immediately but slowly pour the cream into the pan. (The mixture will steam and bubble up, so wear oven mitts and be very careful to avoid splatters and steam burns.) When the bubbling subsides, gently stir to completely blend the cream into the caramel. If you have lumps of hardened caramel in your pan, simply put the pan over low heat and stir until the caramel is melted. MAKE THE BASE 4. Once the caramel is completely smooth, stir in the milk along with the salt and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining ¼ cup sugar. Set aside. 6. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 7. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 8. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use

it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 9. When the base is completely chilled, freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. NOTE: This ice cream has a much softer consistency than other ice creams due to its higher sugar content, and as a result it does not work well in ice cream cakes and pies. Save this one for scooping. SERVE IT WITH … • Crème Fraîche Ice Cream • Coffee Toffee Ice Cream (variation of recipe) • Honey Lavender Ice Cream — a favorite combination of our guests! • Hot Fudge Sauce and Marcona almonds

Brown Sugar Ice Cream with a Ginger-Caramel Swirl

R014 BROWN SUGAR ICE CREAM A GINGER-CARAMEL SWIRL

Reference formulation — not released for production. Source S129, PDF pages 127–130.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BROWN SUGAR ICE CREAM with A GINGER-CARAMEL SWIRL Makes about 1 quart |

Pictured here Kris loves to tinker with ice cream. Every time she tries a new flavor that she loves, she goes home and re-creates it with her own spin, like with this recipe. The original was good in theory, but it was overloaded with candied ginger and gingerbread and simply had too much going on. Kris thought, “If it just focused on a few ingredients, it would be so much better.” The result is proof that the simple combination of brown sugar, ginger, and caramel is all you need for an amazing explosion of flavor. This started out as a Christmas flavor because it pairs so nicely with spiced things like gingerbread. After the holidays were over and we stopped making it, people demanded that we bring it back, so now it’s always in the case and our guests enjoy it all year long. AT A GLANCE TECHNIQUES:

Ice cream , Caramel SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup packed dark brown sugar 1¾ cup heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt FOR THE SWIRL ¾ cup heavy cream

1 cup granulated sugar 1 teaspoon jarred ginger spread (see Note) ⅛ teaspoon kosher salt MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the brown sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining brown sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. WHILE THE ICE CREAM BASE COOLS, MAKE THE SWIRL 6. Set the cream by the stove so it’s at hand when you need it. Put 2 tablespoons of the sugar in a heavy nonreactive saucepan, and put the pan over medium-high heat. When the sugar is melted around

the edges and starts turn amber in places (about 2 minutes), stir the mixture gently and add another 2 tablespoons sugar to the pan. 7. Continue to add the remaining sugar 2 tablespoons at a time, stirring frequently and allowing most of the sugar to melt before you add more. Watch carefully as the sugar darkens, stirring gently to help it melt evenly.

TIP:

Keep in mind that the flavor of the ice cream hinges on how dark you take the caramel. We take ours to a very dark, almost reddish, stage, which produces our intense signature flavor. 8. When the caramel becomes a dark mahogany color, remove the pan from the heat and immediately but slowly pour the cream into the pan. (The mixture will steam and bubble up, so wear oven mitts and be very careful to avoid splatters and steam burns.) When the bubbling subsides, gently stir to completely blend the cream into the caramel. If you have lumps of hardened caramel in your pan, simply put the pan over low heat and stir until the caramel is melted. 9. Stir in the ginger paste and salt and let cool. (You can make the swirl up to 2 weeks ahead of time. Keep it refrigerated, but let it come to room temperature before using.) FREEZE THE ICE CREAM 10. When the base is completely chilled, freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. 11. As you transfer the ice cream to the storage container, drizzle in the caramel after every few scoopfuls, using about 6 tablespoons of the caramel (or more if you like). When all the ice cream is in the container, use a chopstick or butter knife to gently swirl the mixture. Enjoy right away or, for a firmer ice cream, freeze for at

least 4 hours.

TIP:

The swirl recipe makes more than you need (the recipe won’t work in smaller quantities). You can thin the leftovers with a little cream and use as a sundae topping, or you can enjoy it right off the spoon! NOTE: Ginger spread is a sweetened jarred (or canned) product that incorporates a potent gingery punch without any bitterness and won’t cause the milk to curdle. And because it’s completely smooth, there’s no need to strain the final sauce. Look for it in the baking aisle of specialty grocery stores or online (see Sources). MAKE IT YOUR OWN

• Stir 2 tablespoons bourbon into the chilled base.

• Use store-bought dulce de leche in place of the

ginger caramel swirl (you get what you pay for, so use a good one). SERVE IT WITH … • Caramelized Banana Ice Cream , Salted Caramel Ice Cream , or Ricanelas Ice Cream for Kris’s favorite combo.

R015 BROWN SUGAR GRAHAM CRACKERS

Reference formulation — not released for production. Source S129, PDF pages 131–134.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BROWN SUGAR GRAHAM CRACKERS Makes about twenty 3-inch crackers | Shown as crackers and as a piecrust These graham crackers are so much more flavorful than the boxed kind. They’re a breeze to make, and once you try them you will wonder why you ever bought the commercial variety. They make a great topping crumbled onto ice cream, go into our favorite crust for the s’mores ice cream pie, and are a fabulous after-school (or after-work) snack. AT A GLANCE CHILLING TIME: At least 2 hours SHELF LIFE: 5 days for cookies, 1 week for crumbs A heaping 1½ cups (7 ounces) unbleached all-purpose flour, plus more as needed for rolling 1⅓ cups (6 ounces) graham flour (see Note) 1 teaspoon baking soda ½ teaspoon kosher salt 1 cup (8 ounces) unsalted butter, at room temperature ⅔ cup packed dark brown sugar 3 tablespoons honey 3 tablespoons granulated sugar 1 tablespoon ground cinnamon MAKE THE DOUGH 1. In a large bowl, combine both flours, the baking soda, and salt and

whisk to blend. Set aside. 2. In the bowl of a stand mixer with the paddle attachment, combine the butter, brown sugar, and honey and beat on medium-high speed until light and fluffy, about 2 minutes. Scrape down the sides of the bowl. Add the flour mixture and mix on low speed just until blended and the dough comes together, about 30 seconds. 3. Transfer the dough onto piece of plastic wrap, press into a 7-inch square, and wrap tightly. Refrigerate for at least 2 hours, or up to 5 days. TO MAKE COOKIES 4. Position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two large baking sheets with parchment paper or a nonstick mat. 5. On a lightly floured surface, roll out the dough to a ⅛-inch thickness and cut into squares (or any shape you want). Transfer to the baking sheet, spacing the cookies at least ¾ inch apart. Gather any scraps, reroll, and cut out more cookies. 6. In a small bowl, combine the granulated sugar and cinnamon and sprinkle the mixture evenly over the cookies. 7. Bake the cookies for 10 minutes and then rotate the baking sheets. Bake for another 6 to 8 minutes, or until the cookies are dark golden brown and just firm to the touch. Let cool for a minute on the baking sheets, then transfer to a cooling rack. Let cool completely (they will crisp up as they cool). Store in an airtight container. TO MAKE CRUMBS FOR AN ICE CREAM PIE 4. Position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats.

5. Break the dough into walnut-sized lumps with your fingers and space them evenly on the baking sheets. 6. In a small bowl, combine the granulated sugar and cinnamon and sprinkle the mixture evenly over the dough. Bake for 10 minutes, then rotate the pans front to back and top to bottom. Continue to bake for another 10 to 15 minutes, or until the cookie pieces are golden brown and just firm to the touch. 7. Let cool completely on the baking sheets. Working in batches as necessary, transfer the cookie pieces to a food processor and pulse until they becomes a coarse meal. Store in an airtight container for up to a week at room temperature; freeze for longer storage. NOTE : Graham flour is similar to whole wheat flour but is ground differently and has a unique consistency as a result. You can substitute whole wheat flour if you like, but the texture will vary slightly.

Caramelized Banana Ice Cream with Brown Sugar Graham Crackers and Caramel Sauce

R016 ALMOND TOFFEE

Reference formulation — not released for production. Source S129, PDF pages 135–137.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

ALMOND TOFFEE Makes 4 cups chopped toffee |

Pictured here and here What would we do without toffee? We love it and think it makes everything taste better (kind of like bacon!). We use it as a mix-in for ice cream, serve it as a topping (it’s one of our most popular options), add it to cookies, top cupcakes with it, eat handfuls of it … pretty much anything goes! AT A GLANCE SPECIAL EQUIPMENT: Candy thermometer COOLING TIME: 1 hour SHELF LIFE: 2 weeks or longer Nonstick cooking spray, for the pan (optional) 1 cup (8 ounces) unsalted butter ¾ cup sugar ¼ cup tapioca syrup or corn syrup 3 tablespoons water ½ teaspoon kosher salt 1 cup toasted slivered almonds (see Buying and Using Nuts) 1. Line a large rimmed baking sheet with parchment paper or a nonstick mat, or spray it with nonstick cooking spray, and set aside. 2. Combine the butter, sugar, tapioca syrup, water, and salt in a medium saucepan and attach a candy thermometer. Put the pan over medium heat and cook, stirring frequently, until the mixture is dark amber and reaches 300°F, also known as the “hard crack” stage, 20 to 25 minutes.

TIP:

Don’t walk away from the pan, especially once it reaches around 250°F, when the mixture becomes more likely to burn. 3. As soon as it reaches 300°F and the toffee is a deep brown color, take the pan off the heat, remove the thermometer, and stir in the almonds. Pour the mixture onto the prepared baking sheet and use a heatproof spatula to spread it out to a ¼-inch thickness. (Be careful —it’s extremely hot!) 4. Let cool for about an hour. If the top of the toffee sheet looks or feels a little greasy, just blot it off with a paper towel. Break or chop the toffee into chunks. This recipe may seem like it makes a lot of toffee, but it can be stored in an airtight container for a couple weeks. NOTE: This is technically a candy recipe, not a caramel recipe, but the results are similar. And, just like when making caramel, timing is of the essence when making candy. For the best results, read through the entire recipe, measure out all of your ingredients, and set out the necessary equipment before you fire up the stove. A candy thermometer is essential. MAKE IT YOUR OWN

• Substitute any other nut for the almonds. We

find, however, that slivered almonds provide the best textural contrast.

• Add ¼ teaspoon cayenne pepper to the sugar

mixture. (Kris loves this spicy/sweet combo!)

Toffee Chip Cookies

R017 TOFFEE CHIP COOKIES

Reference formulation — not released for production. Source S129, PDF pages 138–140.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

TOFFEE CHIP COOKIES Makes about 40 cookies |

Pictured here This is one of those recipes that came about as a happy accident. We had been tinkering with our pecan toffee recipe but hadn’t quite gotten it right. Rather than toss out the not-quite-perfect outcome, we chopped the toffee and added it to a batch of cookie dough. The result was the ideal union of a candy and a cookie. Toffee Chip Cookies have become even more popular than our Chocolate Chip Cookies! AT A GLANCE CHILLING TIME: 2 hours or up to overnight SHELF LIFE: 5 days 2⅔ cups (12 ounces) unbleached all-purpose flour 1 teaspoon baking powder ½ teaspoon kosher salt ¼ teaspoon baking soda ¾ cup (6 ounces) unsalted butter, at room temperature ¾ cup granulated sugar ¾ cup packed light or dark brown sugar 3 large eggs 1½ teaspoons pure vanilla extract 2 cups coarsely chopped Almond Toffee 3½ ounces bittersweet chocolate (60% to 65% cacao; see Note), coarsely chopped (about 1 cup) 1. In a medium bowl, combine the flour, baking powder, salt, and baking soda and whisk to combine. Set aside.

2. In the bowl of a stand mixer with the paddle attachment, combine the butter and both sugars. Mix on medium-high speed until light in color and fluffy, about 2 minutes. Scrape down the bowl and, with the motor running, add the eggs one at a time, completely mixing in each egg before adding the next. Scrape down the bowl, add the vanilla, and mix until blended, about 15 seconds. Add the toffee and chocolate and mix on low speed just until blended. Add the flour mixture and mix on low speed just until the dough comes together, about 15 seconds. 3. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. 4. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 5. Scoop up 2 tablespoons of dough (we use a 1-ounce ice cream scoop) and form the dough into a ball. Repeat until all the dough has been shaped. Place the balls 2½ inches apart on the baking sheets. Flatten the balls slightly with the palm of your hand so that they’re about ½ inch thick. 6. Bake for 6 minutes, then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies are golden on the edges and just barely set in the center, 6 to 7 minutes longer. 7. Let the cookies cool for a minute on the baking sheets, then transfer to a rack and let cool completely. Bake the remaining dough balls. Store the cookies in an airtight container.

TIP:

If you leave your toffee in larger pieces, the toffee will melt in little pockets, producing a very lacy and crunchy cookie.

TIP:

If you do not want to bake all the cookies at once, scoop the cookie dough

into balls and arrange in a single layer on a baking sheet. Freeze until solid, then transfer to a zip-top bag and keep in the freezer until the desire for a warm cookie calls. NOTE : We prefer to use hand-chopped chocolate, but chocolate chips can easily be substituted. However, bittersweet chocolate is preferable to semisweet here, as the toffee already contributes a lot of sweetness and bittersweet chocolate provides a nice contrast.

R018 CARAMEL SAUCE

Reference formulation — not released for production. Source S129, PDF pages 141–147.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CARAMEL SAUCE Makes about 1¼ cups |

Pictured here and here This sauce is very simple but very delicious. We always take our caramel to that dark mahogany color, which produces a fairly robust, slightly bitter caramel flavor. If you prefer something a little tamer, just add the cream when the sugar is a lighter shade. After a few tries you will find the color of caramel that is perfect for your taste. This sauce is best served just warm, poured over your favorite ice cream or any other dessert. It's great with apple pie, between layers of chocolate cake, or drizzled on a sundae. AT A GLANCE TECHNIQUES:

Caramel COOLING TIME: About 1 hour SHELF LIFE: 2 weeks ¾ cup heavy cream, at room temperature 1 cup sugar ¼ teaspoon kosher salt 1. Set the cream by the stove so it's at hand when you need it. Put 2 tablespoons of the sugar in a heavy nonreactive saucepan and put the pan over medium-high heat. When the sugar is melted around the edges and starts turn amber in places (about 2 minutes), stir the mixture gently and add another 2 tablespoons sugar to the pan.

2. Continue to add the remaining sugar 2 tablespoons at a time, stirring as needed and allowing most of the sugar to melt before you add more. Watch carefully as the sugar darkens, stirring gently to help it melt evenly. 3. When the caramel becomes a dark mahogany color, remove the pan from the heat and immediately but slowly pour the cream into the pan. (The mixture will steam and bubble up, so wear oven mitts and be very careful to avoid splatters and steam burns.) When the bubbling subsides, gently stir to completely blend the cream into the caramel. If you have lumps of hardened caramel in your pan, simply put the pan over low heat and stir until the caramel is melted. 4. Stir in the salt and let cool until just warm. (The sauce will stay rippin' hot for quite a while, so resist the urge to lick the spoon.) If not using within a few hours, transfer to a container and refrigerate. Rewarm before using. MAKE IT YOUR OWN

• Create another layer of flavor by replacing up to

¼ cup of the cream with another liquid once the caramel is made and still warm. Try bourbon (a personal favorite of ours), apple juice, coffee, or calvados (a French apple brandy).

CHOCOLATE WHIPPED CREAM

UNLESS YOU'VE WORKED IN A BAKERY, you may not realize just how much manual labor goes into making ice cream and baked goods. This truth is perhaps best exemplified by chocolate. We get our chocolate in 11-pound blocks, which have to be chopped into small pieces before they can be used in our recipes. Our hardworking prep cooks are responsible for this task, chopping more than 220 pounds of chocolate every week! The guys demonstrate a healthy amount of competition, each one

boasting to be the fastest or most efficient, and each with his own unique technique. Selvin likes to think he’s the best and tries to indoctrinate everyone with his method of breaking the block into smaller chunks before chopping each individually. Some of the other guys rest the slab on its side, nestle the short end under their arms, and use a knife to shave down the other side. It helps to have a little bit of a gut for that technique; it acts as a cushion against the hard block of chocolate (like those pictured at the beginning of the chapter). BUYING AND USING CHOCOLATE It’s very easy to spend a lot of money on a relatively small quantity of chocolate. To a certain extent, spending more will get you a better product. However, for baking and confectionary purposes (like making ice cream), there is a point of diminishing returns as far as chocolate goes. The best rule of thumb is to use chocolate that is of good quality but is not outrageously expensive. At the Creamery, we use several different brands of chocolate, but the one we use most often is one you might find at your grocery store: Callebaut, a brand that is the favorite of many a pastry chef. Far more important than choosing the brand of chocolate is using the correct type of chocolate for the recipe. By this we mean matching the cacao percentage specified in the recipe. This number, which appears prominently on the label of most high-quality chocolates, indicates the proportion of cacao solids relative to the other ingredients (which are almost always sugar, cocoa butter, vanilla, and lecithin, an emulsifier).

The higher the percentage of cacao, the less sugar and fat there is in the chocolate. This is important not just for flavor but also for the chemistry of the recipe itself. Using a very dark chocolate instead of the prescribed semisweet in a recipe can produce results that differ in texture, flavor, and consistency from those that were intended. Unfortunately, many recipes in other books don’t specify the type of chocolate they want you to use, and, on top of that, chocolate labels can be confusing and inconsistent from one brand to the next. To help clarify things, here’s a brief rundown of the basic categories of chocolate, and some brands that we like of each type. Unsweetened chocolate contains cacao solids and cocoa butter but no sugar. Using unsweetened chocolate gives the baker more control over how much sugar goes into a recipe and more control over what kind of sweetener to use (for instance, you might want to use honey instead of sugar). We use Callebaut for our unsweetened chocolate but Valrhona is another good choice. Bittersweet chocolate is basically unsweetened chocolate with sugar, lecithin, and vanilla incorporated into the mix. Sugar makes the chocolate tastier (take a nibble of unsweetened chocolate if you don’t believe us) and makes it a good multipurpose chocolate, suitable for

R019 CHOCOLATE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 152–156.

Original source recipe evidence

CHOCOLATE ICE CREAM Makes about 1 quart |

Pictured as an ice cream sandwich As we were developing the recipes for this book, we made two different batches of our chocolate ice cream, one using natural cocoa powder and one using Dutch-processed. The results were astounding. The version made with Dutch cocoa was dark, intense, and trufflelike in its flavor, while the natural version seemed more like milk chocolate ice cream. The results are addictive either way. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar ¼ cup Dutch-processed or natural cocoa powder, measured then sifted (see headnote) 1 cup 1% or 2% milk 1¾ cups heavy cream ¼ teaspoon kosher salt 1 teaspoon pure vanilla extract MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Set aside. 2. In a heavy nonreactive saucepan, combine the cocoa powder with the remaining sugar (6 tablespoons). Whisk in about ¼ cup of the milk to

make a paste, adding a little more of the milk as needed to make it smooth and uniform. (If you add the milk all at once, the cocoa will be lumpy.) Whisk in the remaining milk, the cream, and salt and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Add the vanilla to the base and stir until blended. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Fold in chopped toasted hazelnuts (see

Buying and Using Nuts) for a Nutella-like effect.

• Add a swirl of

Fudge Ripple for chocolate-on- chocolate action. SERVE IT WITH … • Blackberry Ice Cream or Orange-Cardamom Ice Cream

Sam’s Sundae SAM’S SUNDAE

One of the most popular sundaes at the Creamery was invented by (and named after) Anne’s husband, Sam. It features Chocolate Ice Cream topped with bergamot olive

oil, a sprinkle of Maldon sea salt, and a dollop of whipped cream. The citrusy olive oil is a perfectly luxurious match for the chocolate, and the salt leaves your taste buds wanting more.

R020 CHAI-SPICED MILK CHOCOLATE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 157–159.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHAI-SPICED MILK CHOCOLATE ICE CREAM Makes about 1 quart Imagine mixing hot chocolate with chai tea and then churning it into ice cream. This recipe gives you just that! It’s a sophisticated mixture of warm, wintry, exotic spices tempered by creamy milk chocolate. It was inspired by a “milk chocolate masala” candy bar that Kris bought during her travels. As she tasted it with her husband, Nate, she immediately realized how good it would be as an ice cream. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 30 minutes to infuse the cream, 2½ hours or overnight to chill the base SHELF LIFE: 1 week 15 whole black peppercorns 10 whole cloves 7 green cardamom pods 2 cinnamon sticks 2 whole star anise 1¼ cups heavy cream 1 cup 1% or 2% milk ¼ cup sugar ¼ teaspoon kosher salt 5 large egg yolks 6 ounces milk chocolate, finely chopped (about 1¼ cups) TOAST THE SPICES 1. Combine the peppercorns, cloves, cardamom, cinnamon, and star anise

in a medium nonreactive saucepan and put the pan over medium-high heat. Toast, stirring frequently, until the spices are aromatic, 2 to 3 minutes. 2. Add the cream, milk, sugar, and salt and increase the heat to medium- high. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for about 30 minutes, or until the cream has taken on a distinct chailike flavor. (Stir it occasionally and taste it to monitor the progress.) MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up and set aside. Put the chopped chocolate in another medium heatproof bowl and set that aside as well. 4. Put the pan of infused cream over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Pour the hot cream mixture into the bowl of chopped chocolate, wash your whisk, and whisk until smooth. 8. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight.

FREEZE THE ICE CREAM 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Add finely chopped milk chocolate or toasted

chopped cashews or macadamia nuts (see Buying and Using Nuts) in the last minute or so of churning. SERVE IT WITH … • Pistachio Ice Cream or Cheesecake Ice Cream

R021 ICE CREAM BITTERSWEET CHOCOLATE CHIPS

Reference formulation — not released for production. Source S129, PDF pages 160–163.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MALTED MILK CHOCOLATE ICE CREAM with BITTERSWEET CHOCOLATE CHIPS Makes about 1 quart Anne says, “This is my all-time favorite ice cream. I first had it in 1991, when I was working for pastry chef Patrick DeLessio at the Stanford Court Hotel in San Francisco. Patrick was inspired by the wonderful malted ice cream flavors created by Steve Herrell of Herrell’s Ice Cream in Northampton, Massachusetts. The malted milk powder contributes an almost earthy sweetness to the milk chocolate ice cream base. Chopped bittersweet chocolate provides textural contrast and a deeper chocolate flavor.” AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 6 large egg yolks 6 ounces milk chocolate, finely chopped (about 1¼ cups) 1¾ cups heavy cream 1 cup 1% or 2% milk ¾ cup malted milk powder (Carnation or a similar product) ½ teaspoon kosher salt 4 ounces bittersweet chocolate (52% to 60% cacao), finely chopped (scant 1 cup) MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up. Put the chopped milk chocolate in another medium heatproof bowl

and set both bowls aside. 2. In a heavy nonreactive saucepan, whisk together the cream, milk, malted milk powder, and salt and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Pour the hot cream mixture into the bowl of chopped chocolate, wash your whisk, and whisk until smooth. 6. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the chopped bittersweet chocolate in the last minute or so of churning, or fold it in by hand after the ice cream comes out of the machine. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours.

MAKE IT YOUR OWN

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

COOKIES and CREAM ICE CREAM Makes about 1¼ quarts |

Pictured here Along with Mint Chip Ice Cream , this is one of the most popular flavors among our younger guests. It’s also one of the only recipes for which we don’t make the mix-in ingredient from scratch. The truth is, it’s hard to improve on the perfection of Newman-O’s, and so that’s what we use. You can use them, too, or try any other cookie you like. The Dark Chocolate Cookies are especially good! AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt 2 teaspoons pure vanilla extract 1¼ cups chopped chocolate cookies (in pieces ¼ inch or larger) MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt,

and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the chopped cookies in the last minute or so of churning, or fold them in by hand after the ice cream comes out of the machine. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH … • Mint Chip Ice Cream —a kid’s dream combo! • Ricanelas Ice Cream —we call this combo with two flavors that feature chopped cookies “The Cookie Monster.”

R023 BROWNIES

Reference formulation — not released for production. Source S129, PDF pages 167–169.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BROWNIES Makes nine 3-inch-square brownies These brownies were one of the first recipes we made for sale at Bi-Rite Market, and they have continued to be a mainstay in our lineup over the years. We started with a borrowed recipe (the source now forgotten), but we tweaked it by upping the amount of unsweetened chocolate for a more intense flavor. The resulting recipe, we think, has it all: the brownies are rich and dark, and you can make them in no time. We use these as the base for our brownie sundae, which is topped with vanilla ice cream, chocolate and caramel sauces, whipped cream, and spiced pecans. It's over the top in the best way possible! AT A GLANCE COOLING TIME: About 1 hour SHELF LIFE: 1 week 1 cup (4½ ounces) unbleached all-purpose flour 1 teaspoon baking powder 1 teaspoon kosher salt ½ cup (4 ounces) unsalted butter, cut into 1-inch pieces, plus more for the pan 4 ounces unsweetened chocolate, coarsely chopped (1 cup) 2 ounces bittersweet chocolate (preferably about 52% cacao), coarsely chopped (½ cup) 1¾ cups sugar 4 large eggs 1. Position a rack in the center of the oven and preheat the oven to 350°F. Butter a 9-inch square baking pan and line the bottom with parchment paper. In a small bowl, whisk together the flour, baking

powder, and salt and set aside. 2. Put 1 inch of water in the bottom of a double boiler or medium saucepan and bring to a simmer over medium-high heat. If you are using a gas stove, make sure the flames are not coming up around the pan, which can cause the chocolate to scorch. In the top of the double boiler or in a medium heatproof bowl, combine the butter and both chocolates. Put the pan or bowl over but not touching the simmering water. Whisk frequently until the chocolates are melted and completely smooth, about 4 minutes. Remove from the heat. If using a double boiler, transfer the chocolate to a medium bowl. 3. Add the sugar to the chocolate and stir until blended. Then add the eggs one at a time, completely blending in each one before adding the next. Add the flour mixture all at once and mix just until blended. (If you prefer, you can mix this batter in a stand mixer with the paddle attachment.) Transfer to the prepared pan and spread to an even thickness. 4. Bake until a toothpick inserted in the center of the brownies comes out with a few moist crumbs clinging to it, 25 to 30 minutes. Let cool completely in the pan before cutting into squares. Store the brownies in an airtight container at room temperature.

TIP:

There's a trick to cutting brownies so that they are perfect squares with clean edges. First, run a knife around the edge of the pan and invert the pan onto a cutting board. (If the brownies don't release on their own, give the pan a good whack onto the board.) Lift off the pan, peel off the parchment, and carefully turn the slab right side up (for more stability, put another cutting board on top of the brownies and hold both boards together as you flip them over). Use a ruler and a knife to measure and lightly mark each point where you plan to cut. Then lay the ruler across the top of the slab to connect two of the opposing points. Repeat with each set of opposing guide marks to make sure they are evenly spaced. When you're ready to make the first cut, hold the ruler in place, line your knife up against

the ruler, and cut straight down (if you make a sawing motion, the crumbs will stick and make ragged edges). Clean off the knife with a damp kitchen towel or rinse it under warm water, dry it off, and make your next cut. MAKE IT YOUR OWN

• Add ½ cup chopped toasted walnuts, pecans, or

almonds (see Buying and Using Nuts) to the batter.

R024 CHOCOLATE CHIP COOKIES

Reference formulation — not released for production. Source S129, PDF pages 170–172.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHOCOLATE CHIP COOKIES Makes about 4 dozen cookies We’ve been making these cookies ever since our days at the restaurant 42 Degrees. The secret is in using chopped bittersweet chocolate, which gives you more variety in size and shape compared to chips; the bigger chunks create the classic pockets of chocolate, and the tiny shards permeate the dough itself, creating a sort of chocolate- on-chocolate effect. AT A GLANCE CHILLING TIME: At least 2 hours or up to overnight SHELF LIFE: 5 days 2½ cups (11¼ ounces) unbleached all-purpose flour 1 teaspoon kosher salt 1 teaspoon baking soda 1 cup (8 ounces) unsalted butter, at room temperature ¾ cups granulated sugar ¾ cups packed brown sugar, preferably dark 2 large eggs ¾ teaspoon pure vanilla extract 9 ounces bittersweet chocolate (52% to 60% cacao), chopped, with the largest pieces the size of chocolate chips (scant 2 cups) 1. In a medium bowl, whisk together the flour, salt, and baking soda and set aside. 2. In the bowl of a stand mixer with the paddle attachment, combine the butter and both sugars. Mix on medium-high speed until lightened in color and fluffy, about 2 minutes. With the motor running, add the

eggs one at a time, blending thoroughly after each addition, then add the vanilla. Scrape down the bowl, add the chocolate, and mix on low speed until combined. Add the flour mixture and mix on low speed just until the dough comes together, about 15 seconds. 3. Cover the bowl with plastic wrap and refrigerate until the dough is firm, at least 2 hours or up to overnight. 4. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 5. Scoop up 2 tablespoons of dough (we use a 1-ounce ice cream scoop) and form the dough into a ball. Repeat until all the dough has been shaped. Place the balls 2½ inches apart on the baking sheets. Flatten the balls slightly with the palm of your hand so that they’re about ½ inch thick. 6. Bake for 7 minutes, then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies are golden brown, 7 to 9 minutes longer. Let the cookies cool for a minute or two on the baking sheets, then transfer to a rack and let cool completely. Repeat with the remaining dough. Store in an airtight container.

Chocolate Midnight Cakes with Vanilla Buttercream Frosting

R025 CHOCOLATE MIDNIGHT CAKE

Original source recipe evidence

CHOCOLATE MIDNIGHT CAKE Makes one 8-inch round cake (enough for 1 ice cream cake) or 16 cupcakes | Shown here and as an ice cream cake We have Mary Cech, pastry chef at San Francisco's famed (and now- closed) Cypress Club, to thank for this versatile recipe. It's best known among our guests as a layer cake topped with cream cheese frosting, but we also use it as the base for ice cream cakes and cupcakes. The crumb is dark—almost black—and so moist that we don't recommend soaking it with syrups or sauces. As an added bonus, the extra moisture gives it an excellent shelf life. AT A GLANCE SPECIAL EQUIPMENT: One round cake pan, 8 inches in diameter and 2 inches deep, or two standard muffin pans COOLING TIME: About 1 hour SHELF LIFE: 5 days Nonstick cooking spray or unsalted butter, for the pans 1½ cups sugar ¾ cup (3½ ounces) unbleached all-purpose flour ¾ cup (3½ ounces) cake flour 1¾ ounces (½ cup) Dutch- processed cocoa powder, measured then sifted 1 teaspoon baking soda ½ teaspoon kosher salt 1½ cups boiling water 2 large eggs ½ cup canola or other neutral-flavored oil

1. Position racks in the upper third and lower third of the oven and preheat the oven to 350°F. If making a cake, spray or butter a round cake pan, 8 inches in diameter by 2 inches deep, and line the bottom with parchment paper. If making cupcakes, line sixteen cups of two standard muffin pans with paper or foil liners. 2. In a mixing bowl, whisk together the sugar, both flours, the cocoa, baking soda, and salt. Gradually whisk the boiling water into the flour, adding about ½ cup of the water at a time, until all the water is added and you have a smooth, thick batter. Whisk in the eggs one at a time, blending well after each addition, then whisk in the oil. You should have a very thin but smooth batter. 3. Pour the batter into the cake pan or divide among the muffin cups. Bake until the cake springs back to a light touch and a toothpick inserted into the center comes out clean, 50 to 55 minutes for the cake and about 25 minutes for cupcakes. 4. Let the cake cool in the pan for 30 minutes, then invert onto a wire rack. Remove the parchment and let cool completely. Let the cupcakes cool in the pans for 30 minutes before transferring onto a wire rack, then let cool completely. SERVE IT WITH … • Cheesecake Ice Cream and Chocolate Glaze for a frozen version of our popular layer cake • Berry Compote or Raspberry Swirl Sauce

R026 DARK CHOCOLATE COOKIES

Reference formulation — not released for production. Source S129, PDF pages 175–177.

Original source recipe evidence

DARK CHOCOLATE COOKIES Makes about 50 cookies | Pictured as an ice cream sandwich and as piecrust Just like our Chocolate Midnight Cake , these cookies are so dark as to be almost black. Dark Chocolate Cookies are a wonderful cookie for an ice cream sandwich, crisp but still a little chewy, and they pair nicely with many flavors. AT A GLANCE CHILLING TIME: At least 2 hours or up to overnight SHELF LIFE: 5 days 2⅔ cups (12 ounces) unbleached all-purpose flour 8 ounces (2 cups) Dutch-processed cocoa powder, measured then sifted 4½ teaspoons baking soda ½ teaspoon kosher salt 1¾ cups plus 2 tablespoons (15 ounces) unsalted butter, at room temperature 2 cups granulated sugar 1 cup packed light or dark brown sugar 3 large eggs 1. In a medium bowl, whisk together the flour, cocoa powder, baking soda, and salt and set aside. 2. In the bowl of a stand mixer with the paddle attachment, combine the butter and both sugars. Mix on medium-high speed until lightened in color and fluffy, about 2 minutes. Scrape down the bowl and, with the motor running, add the eggs one at a time, completely mixing in each egg before adding the next.

Scrape down the sides of the bowl, add the flour mixture, and mix on low speed just until the dough comes together, about 30 seconds. 3. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. 4. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. Scoop up 2 tablespoons of dough (we use a 1-ounce ice cream scoop) and form the dough into a ball. Repeat until all the dough has been shaped. Place the balls 2½ inches apart on the baking sheets. Flatten the balls slightly with the palm of your hand so that they’re about ½ inch thick. 5. Bake for 5 minutes, and then rotate the baking sheets top to bottom and front to back. Continued to bake until the cookies are slightly cracked on the surface and feel dry and slightly firm in the center, 5 to 6 minutes longer. (If they feel airy, like a soufflé, they’re not ready.) Let cool for a minute on the baking sheets, then transfer to a rack. Bake the remaining dough balls. Let cool completely and then store in an airtight container.

TIP:

Sometimes having 50 cookies in your kitchen is more temptation than you want at one time! If that’s the case for you, try what we do when making cookies at home: After mixing the cookie dough, shape the dough into balls and line them up snugly on a parchment paper–lined baking sheet. Freeze until solid (about an hour), then transfer to a zip-top storage bag and store in the freezer. They last for weeks this way, and you can bake as many or as few as you like at a moment’s notice. When you’re ready to bake, arrange the dough balls on the baking sheet and let them sit at room temperature to thaw slightly before putting them in the oven. This method will work for any of the cookies in this book.

Original source recipe evidence

CHOCOLATE SHORTBREAD Makes about 28 two-inch cookies, one 9-or 10-inch tart crust, or 4 cups of crumbs We use this recipe to make crusts for ice cream pies as well as for banana cream and other cream pies at the market. In addition to using the crushed crumbs to make a piecrust and for layering them in desserts, you can also roll out the dough to make shortbread cookies or a tart crust. AT A GLANCE CHILLING TIME: 2 hours or up to overnight for cookies or tart crust SHELF LIFE: 10 days for cookies, 2 weeks for crumbs 1 cup (8 ounces) cold unsalted butter, cut into ½-inch cubes 1½ cups (6¾ ounces) unbleached all-purpose flour, more for dusting 1 cup (5⅓ ounces) powdered sugar, measured then sifted 1¾ ounces (½ cup) Dutch-processed cocoa powder, measured then sifted ½ teaspoon kosher salt ½ teaspoon pure vanilla extract MAKE THE DOUGH 1. Combine all of the ingredients in the bowl of a stand mixer with the paddle attachment. Mix on low speed at first, and then increase to medium-low speed and continue mixing until the dough is smooth and just comes together in a solid mass, 1½ to 2 minutes. TO MAKE COOKIES 2. Turn the dough out onto a piece of plastic wrap and shape into a disk 1 inch thick. Wrap in the plastic wrap and refrigerate until firm, 1 to 2 hours or up to overnight. 3. When you’re ready to bake, position racks in the top and bottom

thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 4. On a lightly floured surface, roll the dough to ¼-inch thickness (or slightly thicker or thinner, if you like). Using a cookie cutter (or a knife for free-form shapes), cut out cookies from the dough. If you use a cutter, gather and reroll the scraps up to two more times; any more than that and the cookies will become tough. 5. Arrange the cookies at least ¾ inch apart on the baking sheets and bake for 8 minutes. Rotate the sheets top to bottom and front to back and continue to bake until they give just slightly to the touch, 4 to 6 minutes longer. 6. Let cool on the baking sheets for 5 minutes, then gently transfer to a rack (the cookies are very delicate when warm, but will become slightly sturdier as they cool). Let cool completely. Store in an airtight container. TO MAKE A TART CRUST 2. Turn the dough out onto a piece of plastic wrap and shape into a disk 1 inch thick. Wrap in the plastic wrap and chill in the refrigerator until firm, 1 to 2 hours or up to overnight. 3. When you’re ready to bake, position a rack in the center of the oven and preheat the oven to 350°F. 4. On a lightly floured surface, roll the dough to ¼-inch thickness. Transfer to a tart pan 9 or 10 inches in diameter either by rolling the dough loosely around the rolling pin and unrolling over the pan, or by sliding the removable tart pan bottom under the dough and using it to transfer the dough into the pan. Being careful not to press or stretch the dough, gently ease the dough into the corners of the pan. Remove the excess dough along the top edge of the pan using a small knife or your fingers. Prick the bottom of the dough with a fork at 1-inch intervals.

5. Bake until the crust looks dry in the center, about 20 minutes. When you take it out of the oven, gently press down on any air bubbles that may have formed. Let cool completely on a rack. TO MAKE CRUMBS FOR AN ICE CREAM PIE 2. Position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 3. Break the dough into walnut-sized lumps with your fingers and space them evenly on the baking sheets. Bake for 10 minutes, then rotate the pans front to back and top to bottom. Continue to bake for another 10 to 15 minutes, or until they give just slightly to the touch. 4. Let cool completely on the baking sheets. Working in batches as necessary, transfer the shortbread to a food processor and pulse until it becomes a coarse meal. Store in an airtight container at room temperature.

R028 HOT FUDGE SAUCE

Reference formulation — not released for production. Source S129, PDF pages 181–182.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

HOT FUDGE SAUCE Makes about 1¼ cups |

Pictured here This recipe came to us from our friend Tommy Weber. It is a rich, thick, and decadent sauce that makes any type of ice cream a real treat! The sauce has a wonderful consistency—thick and pourable when warm, it becomes ever so slightly chewy as it cools. We love the transformation that takes place as it comes in contact with ice cream. AT A GLANCE SHELF LIFE: Up to 3 weeks ½ cup heavy cream ½ cup sugar 2 tablespoons Dutch-processed cocoa powder, measured then sifted ¼ cup tapioca syrup or corn syrup ½ teaspoon kosher salt 2 ounces bittersweet chocolate (about 60% cacao), finely chopped (½ cup) 2 ounces unsweetened chocolate, finely chopped (½ cup) ½ teaspoon pure vanilla extract 1. In a medium nonreactive saucepan, stir together the cream, sugar, cocoa, tapioca syrup, and salt. Put the pan over medium-high heat, bring to a boil, and cook just until the sugar has completely dissolved. Remove from the heat. 2. Stir in both chocolates and the vanilla until the chocolate is melted and the sauce is completely smooth. (If you have any lumps, use a spatula to gently press and smear them against the bottom of the pan as you stir.) Serve right away or store in an airtight container in the refrigerator (it lasts for weeks, if you have that much self- restraint). To rewarm, heat in the microwave at half power for a minute or two.

TIP:

If some of the chocolate refuses to melt, it means the cream was not hot enough. To fix this, bring 1 inch of water to a simmer in a medium saucepan, transfer the sauce to a heatproof bowl, and put the bowl over but not touching the water. Whisk the sauce until smooth. SERVE IT WITH …

• Everything. Seriously. Even a spoonful in your

coffee.

R029 CHOCOLATE GLAZE

Reference formulation — not released for production. Source S129, PDF pages 183–184.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHOCOLATE GLAZE Makes about 2 cups |

Pictured here While the Hot Fudge Sauce is thick and rich, this glaze is a little thinner in consistency and shinier in appearance. We put it between cake layers, drizzle it on pies, and dip the tops of frosted cupcakes into it. Used on ice cream cake or pies, the glaze needs to be just warm enough to pour but not hot. Work quickly to cover the surface, because it will pull away from the ice cream if you overwork it. Use ½ cup of glaze for an 8-inch cake. AT A GLANCE SHELF LIFE: Up to 3 weeks 8 ounces bittersweet chocolate (about 60% cacao), finely chopped (¾ cup) 3 tablespoons tapioca syrup or corn syrup 1 cup heavy cream 3 tablespoons sugar 1. Put the chocolate in a medium heatproof bowl, pour the tapioca syrup over the chocolate, and set aside. 2. Stir together the cream and sugar in a small nonreactive saucepan and put the pan over medium-high heat. When the mixture reaches a simmer (small bubbles will appear and break around the edge of the pan), remove from the heat. Stir until the sugar is dissolved. Pour the mixture over the chocolate and let stand for 1 to 2 minutes. Whisk until smooth.

Let the glaze cool slightly before using (it’s too runny when it’s hot). A little warmer than room temperature is ideal. To glaze the top of an ice cream cake, pour ½ cup of the just- warm glaze onto the top of the cake and spread it quickly. The glaze will start to pull away from the ice cream if you overwork it, so cover the surface in a few quick spreads and place back in the freezer. If making ahead, or if you have leftovers, transfer to a container, cover and store in the refrigerator. To rewarm, heat gently in the microwave or in a double boiler just until it’s barely warm.

TIP:

If some of the chocolate refuses to melt, it means the cream was not hot enough. To fix this, bring 1 inch of water to a simmer in a medium saucepan, transfer the glaze to a heatproof bowl, and put the bowl over but not touching the water. Whisk the glaze until smooth.

R030 CHOCOLATE BUTTERCREAM FROSTING

Reference formulation — not released for production. Source S129, PDF pages 185–186.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHOCOLATE BUTTERCREAM FROSTING Makes about 3 cups (enough to frost an 8-inch cake, 16 to 18 cupcakes, or 2 ice cream cakes) This is another old-fashioned recipe, much like the Vanilla Buttercream Frosting . Fluffy, light, and not overly sweet, it is as delicious as it is easy to make. You can use natural or Dutch-processed cocoa powder here with equally good results; the natural will give you a “milk chocolate” flavor, while the Dutch-processed will yield a darker and more intense frosting. This recipe can easily be halved. AT A GLANCE SHELF LIFE: 2 weeks 1 pound unsalted butter, at warm room temperature and cut into ½-inch slices 1½ cups (8 ounces) powdered sugar, measured then sifted ⅔ cup (2⅓ ounces) natural or Dutch-processed cocoa powder, measured then sifted 2 tablespoons water 2 teaspoons pure vanilla extract ½ teaspoon kosher salt 1. Combine all of the ingredients in the bowl of a stand mixer with the paddle attachment. Beat first on low speed, then increase to medium-high speed and continue to beat until the frosting is light and fluffy, 3 to 4 minutes. Scrape the sides of the bowl and mix briefly again. 2. Use immediately or cover and refrigerate for up to 2 weeks. If

made ahead, let the frosting come to room temperature before using and remix briefly using the stand mixer until it regains its light and fluffy consistency. MAKE IT YOUR OWN

• Add ¼ teaspoon peppermint extract.

• Fold in finely chopped chocolate, nuts,

Almond Toffee , or Peanut Brittle .

R031 CHOCOLATE WHIPPED CREAM

Reference formulation — not released for production. Source S129, PDF pages 187–193.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHOCOLATE WHIPPED CREAM Makes about 1½ cups This simple recipe uses cream and bittersweet chocolate (rather than the more commonly called-for cocoa) and produces a rich and dense whipped cream, sort of like a mousse or a whipped ganache. Be sure to budget time to refrigerate the mixture, as this makes the whipping much easier. Use this as a topping for ice cream cakes or pies, sandwiched in the middle of a layer cake, or as an accompaniment to any dessert. AT A GLANCE CHILLING TIME: 1 to 2 hours SHELF LIFE: None—use right away 3 ounces bittersweet chocolate (52% to 60% cacao), finely chopped (heaping ½ cup) 1 cup heavy cream 1. Put about 2 inches of water in the bottom of a medium saucepan and bring to a simmer over medium-high heat. Put the chocolate in a heatproof nonreactive bowl and set over but not touching the simmering water. 2. Whisk the chocolate until melted, then whisk in ¼ cup of the cream. When completely smooth, add the remaining cream in ¼- cup increments, blending well after each addition.

TIP:

Go slowly as you add the cream; adding it too quickly will cause the chocolate to seize up. 3. When all the cream is added and the mixture is completely smooth, remove from the heat and refrigerate for 1 to 2 hours. 4. Remove the bowl from the refrigerator and whisk by hand just until the mixture becomes fluffy. Be careful not to overwhip it, which will result in a stiff, grainy texture. (Don’t be afraid to whip by hand! It takes less than a minute of whipping to achieve the right consistency, and it’s very easy to overwhip this cream using a mixer.) Use immediately. CHOCOLATE SHAVINGS

Here at the Creamery we use chocolate shavings to garnish many of our desserts. We make them by scraping a large chef’s knife (held both at the handle and at the tip of the knife) at an angle across the flat surface of an 11-pound block of chocolate. When the angle is perfect and the temperature of the chocolate is just right, it produces perfect curls of chocolate. Using an 11-pound block of chocolate is obviously not practical for the home cook, but you can approximate the technique using a vegetable peeler and a large chunk of chocolate (the bigger the better). It is important to make sure your chocolate isn’t too warm or too cold; close to body temperature is key to getting the desired curly shapes. Unwrap one end of your chocolate and hold it over a clean work surface. Use your vegetable peeler to pull along one of the flat edges of the

chocolate. The resulting shavings may be flaky at first, but you will get better as you practice. Pick the curls up with an offset spatula (to minimize melting and breakage) and place them directly onto your dessert. If not using the shavings right away, transfer them to a baking sheet and hold them at room temperature (or in the refrigerator if your kitchen is particularly warm) until ready to use.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

COFFEE ICE CREAM Makes about 1 quart When we first opened the Creamery, we featured two different coffee flavors in our case: plain Coffee as well as Coffee Toffee, which was the plain coffee base with almond toffee bits folded in. The crunchy Coffee Toffee became so popular that we eventually took the plain version out of rotation. Here we offer you the original creamy base and give you the option to turn it into Coffee Toffee (see Make It Your Own). We use finely ground coffee, which allows for some of the grounds to pass through the sieve and give some nice texture to the ice cream. For a smoother ice cream, use coarsely ground coffee beans and the finest mesh strainer you have. The strength of flavor can also be intensified or lightened by extending or shortening your steeping time, respectively.

AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ cup (¾ ounce) finely ground coffee ¼ teaspoon kosher salt 5 large egg yolks INFUSE THE MILK/CREAM 1. In a nonreactive heavy saucepan, stir together the cream, milk, half of the sugar (¼ cup), coffee, and salt. 2. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for about 10 minutes, or until the cream has taken on a strong coffee flavor. (Stir occasionally and taste it to monitor the

progress.) MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining half of the sugar (¼ cup). Uncover the cream mixture and put the pan over medium heat. 4. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and- cream mixture from the bowl into the pan. 5. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 3 minutes longer. 6. Strain the base through a fine-mesh strainer into a clean container. Set the container into

an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Add 1 cup finely chopped

Almond Toffee in the last minute of churning to make Coffee Toffee. It’s one of our “greatest hits” and super good!

• Swirl in ⅓ to ½ cup of

Fudge

Ripple for a mocha effect. SERVE IT WITH … • Ricanelas Ice Cream to emulate a cinnamon cappuccino • Vanilla Ice Cream —the Coffee Ice Cream makes the vanilla seem even creamier!

• A sprinkle of

Almond Toffee and a drizzle of Hot Fudge Sauce

R033 ESPRESSO FUDGE SAUCE

Reference formulation — not released for production. Source S129, PDF pages 204–206.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

ESPRESSO FUDGE SAUCE Makes about 1 cup This versatile sauce has a nice shine and wonderful deep chocolate flavor. If you do not want the coffee flavor you can replace the espresso with water. AT A GLANCE SHELF LIFE: up to 3 weeks ½ cup sugar ¼ cup water 1¾ ounces (½ cup) Dutch-processed cocoa powder, measured then sifted 1 ounce bittersweet chocolate, finely chopped (scant ¼ cup) ¼ teaspoon kosher salt ½ cup freshly brewed espresso or very strong coffee ½ teaspoon pure vanilla extract 1. Mix the sugar and water in a small saucepan. Dip your fingers or a pastry brush in water and wash down the sides of the pan (stray sugar crystals can prevent the syrup from melting

evenly). Put the pan over medium-high heat, bring to a boil, and cook until the sugar is completely dissolved. Remove from the heat. 2. Combine the cocoa powder, chopped chocolate, and salt in a medium heatproof bowl. 3. Pour the sugar syrup over the chocolate and let stand without stirring for 1 to 2 minutes. Whisk until smooth and slowly whisk in the espresso and vanilla. Let the sauce cool slightly and use warm or at room temperature. Transfer any unused sauce to a covered container and store in the refrigerator. Rewarm before using.

Espresso Granita with Whipped Cream

R034 ESPRESSO GRANITA

Reference formulation — not released for production. Source S129, PDF pages 207–209.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

ESPRESSO GRANITA Makes about 1½ quarts This adults-only granita pairs well with a dollop of lightly whipped cream and a few cookies or with a scoop of vanilla ice cream (or any other flavor that you like with coffee). The recipe calls for 3½ cups of very strong coffee. You can pull a lot of shots of espresso, or you can use a very fine grind of dark roast coffee and brew it in a French press, which will give you coffee that is full-bodied and flavorful enough to approximate espresso. AT A GLANCE TECHNIQUE:

Granita SPECIAL EQUIPMENT: Espresso maker or French coffee press FREEZING TIME: 4 hours

SHELF LIFE: 1 week 3½ cups freshly brewed espresso or very strong coffee ¾ cup sugar MAKE THE BASE 1. Combine the espresso and sugar in a medium bowl and stir until all the sugar has dissolved. FREEZE THE GRANITA Pour into a 9 by 13-inch baking dish or similar shallow pan. Freeze uncovered for 1½ hours, or until ice crystals start to form. Stir the mixture with a fork to break up the crystals. Return the baking dish to the freezer and stir every 30 minutes or so to break up the ice crystals as the granita freezes. When the granita is completely frozen (about 4 hours total), it should have a light, feathery texture. Serve right away or transfer the granita to a container and store in the freezer. Break up the mixture with a fork just before serving.

SERVE IT WITH … • Brown Butter Pecan Ice Cream

• A dollop of

whipped cream — either vanilla or chocolate — for a cappuccino effect

R035 GREEN TEA ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 210–212.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

GREEN TEA ICE CREAM Makes about 1 quart When making green tea ice cream, it is best to use finely ground green tea powder, called matcha , which easily dissolves into the milk and cream and infuses the ice cream base with a full flavor. You can find it in the tea section of some supermarkets or buy it from a tea specialist (see Sources). AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks 1 tablespoon matcha powder ¾ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt

MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the matcha and half of the sugar (6 tablespoons). Try to make sure that the matcha is evenly distributed and not clumpy. Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (6 tablespoons) and put the pan over medium- high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and- cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula,

about 1 to 2 minutes longer 5. Strain the base through a fine-mesh strainer into a clean container. (Don’t worry if you still have a few tiny clumps of matcha powder; they’ll smooth out as the ice cream churns.) Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours.

R036 EARL GREY ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 213–217.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

EARL GREY ICE CREAM Makes about 1 quart We tried many types of tea before settling on this one for our ice cream. Earl Grey, a black tea infused with the citrus fruit bergamot, has a distinctive fruity flavor that really comes through even when combined with milk, cream, sugar, and eggs and frozen into ice cream. Other black teas will work well in this recipe, too. Whichever kind of tea it is, be sure that it is good, fresh loose-leaf tea. Older tea will not have as much flavor and will require a longer steeping time. To prevent little bits of tea leaves from infiltrating the final product, use the finest-mesh strainer you have. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 2 hours or

overnight SHELF LIFE: 1 week 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar 3 tablespoons loose-leaf Earl Grey tea ¼ teaspoon kosher salt 5 large egg yolks INFUSE THE MILK/CREAM 1. In a heavy nonreactive saucepan, stir together the cream, milk, half of the sugar (¼ cup), the tea, and salt. 2. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for about 10 minutes, or until the cream has taken on the distinct flavor of Earl Grey tea. (Stir occasionally and taste it to monitor the progress.)

MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining half of the sugar (¼ cup). Uncover the cream mixture and put the pan over medium heat. 4. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and- cream mixture from the bowl into the pan. 5. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, about 3 minutes longer. 6. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool.

Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Use any high-quality loose-

leaf tea. Oolong is especially good. SERVE IT WITH … • Orange-Cardamom Ice Cream • Hot Fudge Sauce or Caramel Sauce

• Shortbread or Chocolate Shortbread

R037 EARL GREY SPRITZ COOKIES

Reference formulation — not released for production. Source S129, PDF pages 218–224.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

EARL GREY SPRITZ COOKIES Makes about 3 dozen cookies Spritz cookies, made by extruding soft cookie dough through a special press fitted with a decorative die, have an undeniable nostalgia factor for us. They are pretty and festive, and we always make a few flavors of them during the holidays. These unique and aromatic cookies get their flavor by infusing the butter with Earl Grey tea. It is a very easy recipe, but be sure to set aside enough time to chill everything. Plan on 3 hours to chill the butter and another 2 hours for the dough. You can infuse and chill the butter a day or two in advance of making the dough. Most people don’t have a cookie press, so the recipe below describes shaping the dough into balls by hand. If you have a press, however, you should use it. Just skip the step where you chill the dough, which would make it too stiff to go through the die.

AT A GLANCE CHILLING TIME: 3 hours for the butter, plus 2 hours or up to overnight for the dough SHELF LIFE: 5 days 1 cup (8 ounces) unsalted butter, cut into 1-inch cubes 3 tablespoons loose-leaf Earl Grey tea 1 tablespoon bergamot olive oil (see Note) 2¼ cups (10 ounces) unbleached all-purpose flour 1 teaspoon kosher salt ¾ cup (3½ ounces) powdered sugar, measured then sifted, plus about ½ cup more for rolling 2 large egg yolks 1 teaspoon pure vanilla extract 1. Combine the butter, tea leaves, and olive oil in

a small saucepan and put the pan over medium heat. Stir frequently until the butter is completely melted. Remove from the heat, cover, and let steep for 15 minutes. Strain the butter through a fine-mesh strainer and into a heatproof bowl. Refrigerate until solid, about 3 hours. 2. In a medium bowl, whisk together the flour and salt and set aside. 3. Remove the chilled butter from the refrigerator and transfer it to the bowl of a stand mixer with the paddle attachment, breaking it into 1-to 2-inch chunks as you go. Add the ¾ cup powdered sugar. Mix on low speed at first, and then increase to medium speed and continue mixing until the mixture is smooth, 1½ to 2 minutes. Scrape down the bowl and, with the motor running, add the egg yolks one at a time, completely mixing in each yolk before adding the next. Add the vanilla and mix to blend. Scrape down the sides of the bowl, add the flour mixture, and mix on low speed just until the dough comes together, about 30 seconds.

4. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. 5. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. Scoop up 1 tablespoon of dough and form the dough into a ball. Repeat until all the dough has been shaped. Place the balls 2 inches apart on the baking sheets. Flatten the balls slightly with the palm of your hand so that they’re about ½ inch thick. 6. Bake for 7 minutes, then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies are golden brown on the edges, 8 to 9 minutes longer. Let the cookies cool for a minute on the baking sheet, then transfer to a cooling rack. Once the cookies are completely cool, roll in the ½ cup powdered sugar. Store in an airtight container. NOTE: The bergamot olive oil

we use is made by pressing bergamots (the citrus fruit that gives Earl Grey tea its unique flavor) with ripe olives to produce an aromatic, citrusy olive oil. If you can’t find bergamot olive oil, you can substitute blood orange or lemon olive oil (which are made in the same way) or extra-virgin olive oil. SERVE IT WITH … • Chocolate Ice Cream

R038 CHERRY ALMOND ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 230–233.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHERRY ALMOND ICE CREAM Makes about 1 quart When we worked at the restaurant 42 Degrees, the co- owner (and our friend) Katie Dyer would eagerly anticipate the arrival of summer's cherries, because it meant we would soon be making her favorite flavor of ice cream. It takes a little time to pit the cherries, but you'll find the effort well worth the sublime taste combination of toasted almonds and sweet cherries. Make this as soon as you see cherries looking wonderful at the market because they don't stay around for long! The type of strainer you use will have a significant impact on the texture of this ice cream. A superfine-mesh strainer (called a chinois) will produce a very smooth ice cream, while a regular fine-mesh wire strainer will produce a more rustic-textured ice cream. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 20 minutes, plus 2 hours or overnight SHELF LIFE: 1 week FOR THE CHERRIES 2¼ cups sugar 1½ cups water 2 cups cherries FOR THE BASE ¾ cup whole raw almonds ¾ cup sugar

2 cups heavy cream 1 cup 1% or 2% milk ¼ teaspoon kosher salt 5 large egg yolks POACH THE CHERRIES 1. In a small nonreactive saucepan, combine the 2¼ cups sugar and the water and bring to a boil over medium-high heat. When it reaches a boil, reduce the heat to maintain a gentle simmer, add the cherries, and cook until the cherries are soft and cooked through, about 5 minutes. 2. Remove from the heat and let the cherries cool completely in the syrup. (You can do this step a day ahead; transfer the cherries in the syrup to a covered container and refrigerate until ready to churn the ice cream.) 3. Once cool, drain the cherries (save the syrup for other uses) and squeeze the pits out of the fruit. Chop the cherries into ¼-inch pieces. Refrigerate until you're ready to churn the ice cream.

TIP:

The leftover syrup is infused with lots of fabulous cherry flavor. Drizzle it over ice cream, swirl it into club soda, or use it in our recipes calling for simple syrup. PREPARE THE NUTS 4. Position a rack in the center of the oven and preheat the oven to 350°F. 5. Spread the almonds on a rimmed baking sheet. Bake until the nuts are golden brown and smell nutty, about 15 minutes. Let cool completely. 6. Combine the cooled nuts and the ¾ cup sugar in a food processor. Pulse until very finely ground (about the consistency of sand). Do not overprocess or the mixture will become oily and pasty.

INFUSE THE MILK/CREAM 7. Transfer the almond mixture to a heavy nonreactive saucepan and stir in the cream, milk, and salt. 8. Uncover the cream mixture and put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for about 20 minutes, or until a distinct almond flavor has infused into the mixture. (Taste it to monitor the progress.) MAKE THE BASE 9. In a medium heatproof bowl, whisk the yolks just to break them up. Set aside. 10. Put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 11. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 12. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 13. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM

14. Freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Add the chopped cherries in the last minute or so of churning, or fold them in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. SERVE IT WITH … • Hot Fudge Sauce • Chocolate Shortbread piecrust and Whipped Cream to make an ice cream pie

R039 PISTACHIO ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 234–237.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PISTACHIO ICE CREAM Makes about 1 quart To make ice cream, we prefer to start with raw pistachios and toast them very lightly in the oven. We want to enhance and intensify their flavor without losing the delicate, almost fruity quality of the raw nuts. It can be difficult to find raw pistachios, especially ones that are already shelled. If you can’t get any, buy the toasted kind and skip the toasting step. As for the Cherry Almond Ice cream , the type of strainer you use will have a significant impact on the texture of the ice cream. A chinois will yield a very smooth ice cream, while a regular fine-mesh strainer will give you a more rustic result. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week ¾ cup raw shelled pistachios ¾ cup sugar 2 cups heavy cream 1 ¼ cups 1% or 2% milk ¼ teaspoon kosher salt 5 large egg yolks PREPARE THE NUTS 1. Position a rack in the center of the oven and preheat the oven to

350°F. 2. Spread the pistachios on a rimmed baking sheet. Bake until the nuts are just starting to brown and smell nutty, 5 to 6 minutes. Let cool completely. 3. Combine the cooled nuts and the sugar in the bowl of a food processor. Pulse until very finely ground (about the consistency of sand). Do not overprocess or the mixture will become oily and pasty. INFUSE THE MILK/CREAM 4. Transfer the pistachio mixture to a heavy nonreactive saucepan and stir in the cream, milk, and salt. 5. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for 15 to 20 minutes, or until a distinct pistachio flavor has infused into the mixture. (Taste it to monitor the progress.) MAKE THE BASE 6. In a medium heatproof bowl, whisk the yolks just to break them up. Set aside. 7. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 8. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 9. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path

when you run your finger across the spatula, 1 to 2 minutes longer. 10. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 11. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Use almonds, hazelnuts, peanuts, pecans, walnuts,

or cashews in place of the pistachios. SERVE IT WITH … • Balsamic Strawberry Ice Cream • Vanilla Ice Cream • Crème Fraîche Ice Cream and Hot Fudge Sauce to make a sundae

R040 ALMOND FUDGE RIPPLE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 238–240.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

ALMOND FUDGE RIPPLE ICE CREAM Makes about 1 quart To help our almond ice cream stand up to the more assertive flavor of the fudge swirl, we give it a boost with almond extract in this recipe. Be sure to use pure almond extract rather than the artificial stuff. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup sugar 2 cups heavy cream 1 cup 1% or 2% milk ¼ teaspoon kosher salt ¼ teaspoon almond extract ½ cup chopped toasted almonds (see Buying and Using Nuts) ⅓ to ½ cup Fudge Ripple MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to

medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Whisk the almond extract into the chilled base. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the almonds in the last minute or so of churning, or fold them in by hand after the ice cream comes out of the machine. 8. As you transfer the ice cream to the storage container, drizzle in some of the Fudge Ripple after every few spoonfuls of ice cream. When all the ice cream is in the container, use a chopstick or butter knife to gently swirl the mixture. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. MAKE IT YOUR OWN

• Use pistachios in place of almonds.

SERVE IT WITH … • Peach Leaf Ice Cream , Ricanelas Ice Cream , or Toasted Coconut Ice Cream • Raspberry Swirl Sauce

R041 FUDGE RIPPLE

Reference formulation — not released for production. Source S129, PDF pages 241–241.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

FUDGE RIPPLE Makes about 1⅓ cups We use this ripple in our Almond Fudge Ripple as well as our Peanut Butter Fudge Swirl . You can use it anytime you want to add a ribbon of fudge to your ice cream. Leftovers can be used to make chocolate milkshakes or as a topping for ice cream. AT A GLANCE SHELF LIFE: up to 4 weeks ½ cup plus 2 tablespoons sugar ½ cup water 6 tablespoons Dutch-processed cocoa, measured then sifted ¼ cup tapioca syrup or corn syrup ⅛ teaspoon kosher salt 1 ounce bittersweet chocolate (about 60% cacao), finely chopped (¼ cup) ½ teaspoon pure vanilla extract 1. In a small saucepan, whisk together the sugar, water, cocoa, tapioca syrup, and salt and put the pan over medium-high heat. Whisk frequently as the mixture comes to a simmer. 2. When the sugar has completely dissolved, remove from the heat. Add the chocolate and let sit undisturbed for a minute to allow the heat of the syrup to melt the chocolate. 3. Whisk until smooth, then whisk in the vanilla extract. 4. Transfer to an airtight container and refrigerate until completely chilled. Use the ripple cold (otherwise it will melt your just-churned ice cream when it’s swirled in).

R042 PEANUT BUTTER FUDGE SWIRL ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 242–243.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PEANUT BUTTER FUDGE SWIRL ICE CREAM Makes about 1 quart For those who love peanut butter cups, this is the perfect flavor for you! We prefer to use natural peanut butter, which isn’t as cloyingly sweet as the more processed varieties. This ice cream firms up quite a bit in the freezer; give it a few minutes at room temperature to soften before scooping. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar ⅓ cup smooth natural peanut butter 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ teaspoon kosher salt ⅓ cup Fudge Ripple MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Put the peanut butter in another heatproof bowl and set both bowls aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to

medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into the bowl with the peanut butter and stir to combine. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. 7. As you transfer the ice cream to the storage container, drizzle in some of the Fudge Ripple after every few spoonfuls of ice cream. When all the ice cream is in the container, use a chopstick or butter knife to gently swirl the mixture. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours.

R043 BROWN BUTTER PECAN ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 244–247.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BROWN BUTTER PECAN ICE CREAM Makes about 1 quart Most commercially made butter pecan ice cream contains artificial butter flavor—yuck! Our recipe, inspired by local pastry chef Emily Luchetti, uses the real thing and goes a step further by using browned butter, which is a perfect complement to toasty pecans. Butter is browned by cooking it carefully over low heat until the milk solids darken and develop a nutty flavor. We take it to a deep hazelnut color to ensure the flavor comes through even after the butter is combined with the base. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar 1¾ cups heavy cream ¼ cup (2 ounces) unsalted butter ¾ cup 1% or 2% milk ¼ teaspoon kosher salt 1 teaspoon pure vanilla extract ¾ cup chopped toasted pecans (see Buying and Using Nuts) MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up,

then whisk in half of the sugar (6 tablespoons). Set aside. Set the cream by the stove. 2. Put the butter in a heavy nonreactive saucepan and put the pan over medium heat. The butter will melt and bubble, and after a few minutes it will start to turn brown. Continue to cook until it has a rich, nutty smell and the butter solids (the little specks floating around in the liquid) have turned a dark brown, 6 to 8 minutes total. Add the cream to the pan and stir until blended. (It’s important to mix in the cream before adding the milk to prevent the mixture from breaking.) Add the milk, salt, and the remaining sugar (6 tablespoons) and increase the heat to medium-high. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Add the vanilla to the chilled base and stir until blended. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll

use to store the ice cream into the freezer. Add the pecans in the last minute or so of churning, or fold them in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. SERVE IT WITH … • Chocolate Ice Cream , Caramelized Banana Ice Cream , or Salted Caramel Ice Cream • Great Yellow Cake , Caramel Sauce , and Spiced Pecans for an autumnal ice cream cake

Malted Vanilla Ice Cream with Peanut Brittle and Milk Chocolate Pieces

R044 PEANUT BRITTLE MILK CHOCOLATE PIECES

Reference formulation — not released for production. Source S129, PDF pages 248–249.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MALTED VANILLA ICE CREAM with PEANUT BRITTLE and MILK CHOCOLATE PIECES Makes about 1 quart Like the Malted Milk Chocolate Ice Cream , this recipe was inspired by the malted ice cream at Herrell’s in Massachusetts. They were doing smush-ins long before anyone else, and it was there that Anne first tried malted vanilla ice cream with Heath bar pieces mixed in. It was love at first bite! AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup malted milk powder (such as Carnation) 1¾ cup heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ teaspoon kosher salt 2 ounces milk chocolate, finely chopped or grated (⅓ cup), or make chips using 1 teaspoon oil 1 teaspoon vanilla extract ½ cup chopped Peanut Brittle , in ⅛-inch pieces MAKE THE BASE

1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the malted milk powder. Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, sugar, and salt and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Add the vanilla to the chilled base and stir until blended. 7. Freeze in your ice cream machine according to the manufacturer’s instructions and put the container you’ll use to store the ice cream into the freezer. Add the milk chocolate and the peanut brittle in the last minute or so of churning, or fold them in by hand after the ice cream comes out of the machine. Enjoy right away or, for a firmer ice cream, transfer to a container and freeze for at least 4 hours.

R045 MAPLE WALNUT ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 250–251.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MAPLE WALNUT ICE CREAM Makes about 1 quart If there’s one ice cream flavor that tastes like fall, this is it! Rich maple syrup and walnuts are the perfect pairing of toasty flavors and complementary textures. Pile a couple of scoops on top of pancakes for a decadent breakfast or dessert. Use grade B maple syrup, preferably organic, if you can—it has a more intense flavor than the regular amber variety. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup maple syrup (preferably grade B, organic) 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt ½ cup chopped toasted walnuts (see Buying and Using Nuts) MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the maple syrup (about 6 tablespoons). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining maple syrup (about 6 tablespoons) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and,

whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the walnuts in the last minute or so of churning, or fold them in by hand after transferring the ice cream to a chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours.

R046 MEXICAN WEDDING COOKIES

Reference formulation — not released for production. Source S129, PDF pages 252–254.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MEXICAN WEDDING COOKIES Makes about 2 dozen cookies We have been making these cookies—the perfect accompaniment to a scoop of ice cream—since we first worked together at 42 Degrees. To give the cookies a nice crunch, we roll the shaped dough in granulated sugar. Then, after baking, we give them a snowy coating of powdered sugar. AT A GLANCE CHILLING TIME: 1 to 2 hours or up to overnight SHELF LIFE: 1 week FOR THE DOUGH 1 cup (8 ounces) cold unsalted butter, cut into ½-inch cubes 1 cup (4½ ounces) unbleached all-purpose flour 1 cup (4½ ounces) cake flour ½ cup powdered sugar, measured then sifted ½ cup chopped toasted pecans (see Buying and Using Nuts) ½ teaspoon pure vanilla extract ¼ teaspoon kosher salt FOR ROLLING About ⅓ cup granulated sugar About ½ cup powdered sugar MAKE THE DOUGH AND CHILL 1. Combine all the dough ingredients in the bowl of a stand mixer with the paddle attachment. 2. Mix on low speed at first, and then increase to medium-low speed and continue mixing until the dough is smooth and just comes together in a solid mass, about 1½ minutes. Do not mix beyond this point or the cookies will be tough. 3. Cover the bowl with plastic wrap and chill in the refrigerator until firm, 1 to 2 hours or up to overnight.

BAKE THE COOKIES 4. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 5. Scoop up 1½ tablespoons of dough and form the dough into a ball. Repeat until all the dough has been shaped. Roll the balls in the granulated sugar and arrange them 1½ inches apart on the baking sheets. 6. Bake for 9 minutes, then rotate the sheets top to bottom and front to back. Continue to bake until the cookies are firm to the touch and golden brown on the bottom edge, 6 to 9 minutes longer. Let cool on the baking sheets. Once the cookies have cooled, roll them in the powdered sugar. Store in an airtight container. MAKE IT YOUR OWN

• You can use any type of nut you like. Almonds and

walnuts are really tasty, or you can try the Spiced Pecans .

• Add ½ cup finely chopped bittersweet chocolate

along with the other ingredients.

Top and center: Almond Toffee ; bottom: Peanut Brittle

R047 PEANUT BRITTLE

Reference formulation — not released for production. Source S129, PDF pages 255–256.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PEANUT BRITTLE Makes about 3 cups of 1-to 2-inch pieces Peanut brittle is truly an indispensable ingredient for us at Bi-Rite Creamery. We break it into large pieces and sell it as a candy around the holidays, but we also chop it finely and use it year-round in ice cream and buttercream frostings. It can be used to add a little extra sweetness and crunch to just about any baking recipe. It is important to use raw peanuts in this recipe; toasted nuts will overcook during the candymaking process. AT A GLANCE SPECIAL EQUIPMENT: Candy thermometer COOLING TIME: 1 hour SHELF LIFE: Up to 2 weeks Nonstick cooking spray (optional) 1 cup sugar ½ cup water ½ cup tapioca syrup or corn syrup ¼ teaspoon kosher salt 1½ cups raw shelled peanuts, papery skins removed if necessary ⅛ teaspoon baking soda 1½ teaspoons unsalted butter 1. Line a large rimmed baking sheet with parchment paper or a nonstick mat, or spray with nonstick spray. Set aside. 2. Combine the sugar, water, tapioca syrup, and salt in a small, heavy nonreactive saucepan and attach a candy thermometer. Put the pan over medium heat and cook without stirring until the mixture reaches 280°F, also known as the “soft crack” stage, 20 to 25 minutes.

TIP:

Don’t walk away from the pan, especially once it reaches around 250°F, when the mixture becomes more likely to burn. 3. Remove the thermometer. Stir in the peanuts and continue to stir frequently as the peanuts toast and the syrup browns. When the peanuts are toasted and a golden color and the syrup is a mahogany brown (about 5 minutes longer), remove from the heat. Carefully stir in the baking soda and, once the mixture is blended, stir in the butter. 4. Pour onto the prepared baking sheet and use a heatproof spatula to spread the peanuts in a single even layer about ¼ inch thick. (Work quickly before the brittle hardens, but be careful—it’s extremely hot!) 5. Let cool to room temperature, about 1 hour. If the top of the brittle looks or feels a little greasy, just blot it with a paper towel. Once cool, break into chunks or chop into ⅛-to ¼-inch pieces and store in an airtight container. NOTE: This is a candy recipe, which means that timing is of the essence. For the best results, read through the entire recipe, measure out all of your ingredients, and set out the necessary equipment before you fire up the stove. A candy thermometer is essential. MAKE IT YOUR OWN

• Any kind of nut would work in this recipe, but it is

important to use untoasted nuts. If you were to start with already-toasted nuts, they would likely burn in the process.

R048 SPICED PECANS

Reference formulation — not released for production. Source S129, PDF pages 257–258.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SPICED PECANS Makes 2 cups Whereas many spiced nuts feature a light candylike coating of sugar, ours have a unique crumbly/crunchy texture thanks to the mixture of brown sugar and butter that melts together during baking and helps the spices adhere to the nuts. Use these as an ice cream topping, for snacking, and in just about any recipe that calls for nuts. AT A GLANCE SHELF LIFE: 1 week ¼ cup (2 ounces) unsalted butter, melted ¼ cup packed light or dark brown sugar 1 tablespoon ground cinnamon 1½ teaspoons ground ginger 1½ teaspoons pure vanilla extract ¼ teaspoon kosher salt ⅛ teaspoon ground cloves 2 cups pecan pieces 1. Position a rack in the center of the oven and preheat the oven to 350°F. 2. In a medium bowl, combine all of the ingredients except the pecans and mix well. Add the nuts and toss until they are thoroughly coated in the butter mixture. Transfer to a rimmed baking sheet and spread in a single layer.

3. Bake for 6 minutes, stir, and bake for another 6 to 9 minutes, or until fragrant and the nuts are golden brown. 4. Remove from the oven and let cool on the baking sheet, stirring occasionally to break up the clumps (they tend to stick together as they cool). It is nice, however, to have some clumps, as they are super- tasty to toss in your mouth! Store in an airtight container.

R049 RODNEY'S GRANOLA

Reference formulation — not released for production. Source S129, PDF pages 259–265.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

RODNEY'S GRANOLA Makes about 12 cups This recipe came from one of our former bakers and is a favorite topping for our soft-serve ice creams. It's crunchy, nutty, and has the right amount of chew from the dried fruit. It is also perfect with fruit and milk or yogurt for breakfast. Anne has some every morning! Feel free to substitute other nuts or dried fruits, like chopped dried apricots or dried cherries, to suit your taste. We sprinkle a little Maldon salt over the mixture right before it goes in the oven—it gives the granola a little extra salty crunch—but it's not necessary. AT A GLANCE COOLING TIME: 1 hour SHELF LIFE: Up to 4 weeks 4 cups rolled oats (not instant)

1 cup coarsely chopped raw almonds ¾ cup unsweetened large coconut flakes (aka coconut chips) ¼ cup flax seeds ¼ cup sunflower seeds 1 teaspoon kosher salt ¾ cup packed light or dark brown sugar ¼ cup plus 2 tablespoons maple syrup (preferably grade B, organic) ¼ cup honey 5 tablespoons (2½ ounces) unsalted butter 1 tablespoon pure vanilla extract 1 cup packed raisins 1. Position a rack in the center of the oven and preheat the oven to 300°F. 2. In a large bowl, combine the oats, almonds, coconut, flax and sunflower seeds, and salt. 3. Combine the brown sugar, maple syrup, honey, butter, and vanilla in a small saucepan and put the pan over medium heat. Cook, stirring, until the butter is melted and the sugar is dissolved, about 5 minutes. Pour over the dry ingredients and mix until everything is well coated. 4. Spread on a rimmed baking sheet, press to an even thickness, and bake for 30 minutes. Stir the granola and bake for another 15 to 20 minutes, or until golden brown. Let cool completely on the baking sheet. Stir in the raisins and transfer to an airtight container. Store at room temperature.

SLICED STRAWBERRY TOPPING

BLUEBERRY-LEMON SAUCE

OUR BERRY ICE CREAMS, SORBETS, AND POPS —especially our Balsamic Strawberry Ice Cream —are always in demand, but berries are only in season for about half the year. When they aren't in season, we don't make those recipes. Our guests are sometimes disappointed that their favorite flavor isn't available. However, we use this as an opportunity to talk about the seasonal nature of our products; we want people to understand that when fruits are in season, they taste their best and result in better tasting ice cream and sorbet. We make everything from scratch, use only fresh (not frozen) ingredients, and only when they're truly in season. Ultimately, the proof is in the pudding: our strawberry ice cream is so good because we only use ripe, in-season berries. If we made them with imported, frozen, or not-quite-ripe berries, it just wouldn't be the same. It takes only one taste to understand what a difference it makes. Berries, like any fruit, can be tricky to use in ice cream. Because of their high water content, they often lead to an icy final product. To counteract this, we always cook down our fruit to remove excess water, resulting in a purée that is more concentrated in flavor. This also ensures that the fruit blends evenly into the base, producing a creamy texture with rich flavor. Resist the temptation to add uncooked fruit to ice cream. When frozen, the fruit becomes rock-hard pieces that are an unpleasant contrast to the creaminess of ice cream. The treatment for fruit is different when making sorbets and ice pops. The fruit is always pureed, but generally not cooked down, because the water content is essential for making these types of frozen desserts. Whole berries can be a fun garnish in ice pops as well; see the recipe for Lime-Blackberry Ice Pops , pictured here), which feature whole blackberries. They do freeze

into little nuggets, but they’re so beautiful that we use them anyway. If you’re really set on serving whole berries with your ice cream or sorbet, your best bet is to use them as a topping.

BUYING AND USING BERRIES Take it from us: for the best possible flavor, buy berries from a local grower and buy them only when they’re in season (generally summer, but it depends on where you live and the type of berry). Whether you’re using strawberries, blackberries, blueberries, or raspberries, it’s especially important to go organic; conventional berries are heavily sprayed with herbicides and pesticides, but organic ones are free of these chemicals. Berries do not ripen once picked, so look for deep, even color and taste a few to make sure they’re as good as they should be. Early season strawberries often have white “shoulders” around the leaves, and their flavor doesn’t compare to the fully red ones that come later in the season. Examine the berries carefully (even looking at the sides and underside of the basket) to make sure they’re dry and show no signs of mold or deterioration. Smaller berries are usually better because they are more flavorful than larger ones. Just think about how flavorful tiny wild blueberries and strawberries are versus giant commercially grown ones. Some of that size difference is due to overwatering by growers, which produces bigger but less flavorful fruit. Especially when they’re ripe, berries are very perishable and have a short shelf life. Buy them as close as possible to the time you want to use them (no more than a day ahead), and refrigerate them if not using them that same day. Berries will quickly deteriorate and develop mold after coming in contact with water, so wash them just before you are ready to use them, and wash only as many as you will use right away. (One benefit of using organic berries is that you can sometimes get away without washing them.) If and when you wash your berries, do it gently and properly— simply rinsing berries does not do the trick. Instead, submerge the berries in a large bowl of cold water, allow time for the sand and grit to drop to the bottom, and then gently lift them out with your hands. Repeat as needed until all the sand and grit are gone. Drain in a colander, in the basket they were packed in, or on a towel-lined baking sheet.

R050 BALSAMIC STRAWBERRY ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 268–272.

BALSAMIC STRAWBERRY ICE CREAM Makes about 1 quart |

Pictured here and here In the United States, peanut butter and jelly are considered a perfect match. In Italy, it’s the same thing with strawberries and balsamic vinegar, a classic combination that makes a simple, refreshing dessert. If you’ve never had this stellar pairing, give our frozen version a shot. The vinegar is subtle and adds depth to the bright sweetness of the strawberries. We add it in two stages (with the cooking berries and just before churning) for an even more complex flavor. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week FOR THE STRAWBERRY PURÉE 1½ pints strawberries (3 cups), preferably organic, hulled and halved or quartered 2½ tablespoons sugar 2 teaspoons balsamic vinegar FOR THE BASE 5 large egg yolks

½ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt 2 teaspoons balsamic vinegar COOK THE BERRIES 1. Combine the berries with the 2½ tablespoons sugar and 2 teaspoons vinegar in a large nonreactive skillet. Put the skillet over medium heat and cook, stirring frequently, until the strawberries are soft and the liquid they release has reduced somewhat, 6 to 8 minutes. 2. Let cool slightly, then transfer the berries and their juice to a blender or food processor. Purée until smooth and refrigerate until ready to use. MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of sugar (¼ cup). Set aside. 4. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set

the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 8. Whisk the strawberry purée and the remaining 2 teaspoons vinegar into the chilled base. 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH … • Crème Fraîche Ice cream , Honey Lavender Ice Cream , or Chocolate Ice Cream • Shortbread or Brown Sugar Graham Crackers • Sliced Strawberry Topping • Vanilla and Chocolate ice creams and a banana, sliced lengthwise, for a classic banana split

Original source recipe evidence

WHITE CHOCOLATE RASPBERRY SWIRL ICE CREAM Makes about 1 quart Everyone who works at the Creamery calls this ice cream “Magic of the ’80s.” The name came about thanks to a not-so- favorable review on Yelp, in which the reviewer derided the combination of white chocolate and raspberries for being “very ’80s.” True, the combination was popular back then, but for good reason: the tartness of the raspberries perfectly offsets the creaminess of the white chocolate. The guest eventually took down the review, began dating one of our bakers (they are now engaged!), and now enjoys all the flavors of ice cream (even this one) with great regularity. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¼ cup sugar 5 ounces white chocolate, finely chopped (1¼ cups) 2 cups heavy cream ¾ cup whole milk ¼ teaspoon kosher salt ¼ teaspoon pure vanilla extract ½ cup Raspberry Swirl Sauce MAKE THE BASE

1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (2 tablespoons). Set aside. Put the chopped chocolate in another medium heatproof bowl and set that aside as well. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (2 tablespoons) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into the bowl with the white chocolate and whisk to combine. Set the container into an ice- water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Whisk the vanilla into the chilled base. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. 8. As you transfer the ice cream to the storage container, drizzle in some raspberry purée after every few spoonfuls. When all the ice cream is in

the container, use a chopstick or butter knife to gently swirl the mixture. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. MAKE IT YOUR OWN

• Add finely chopped white chocolate just as the ice

cream finishes churning and before incorporating the raspberry swirl. SERVE IT WITH … • Balsamic Strawberry Ice Cream or Blackberry Ice Cream • Hot Fudge Sauce

• Chopped toasted almonds (see

Buying and Using Nuts)

RASPBERRY SWIRL SAUCE Makes about ½ cup |

Pictured here We use this primarily as a component of our White Chocolate Raspberry Swirl Ice Cream , but it also makes a lovely topping for ice cream sundaes, cakes, or pies. AT A GLANCE CHILLING TIME: 1 hour if swirling into ice cream SHELF LIFE: 1 week 2 half-pint baskets raspberries (2 cups), preferably organic ⅓ cup sugar 1. Combine the raspberries and sugar in a small nonreactive saucepan and put the pan over medium-high heat. Cook, stirring frequently, until most of the liquid has evaporated and the mixture has a jammy consistency, about 20 minutes. Reduce the heat to medium as the mixture thickens to prevent scorching. 2. Remove from the heat and let cool for a minute. Transfer to a blender and purée until smooth, being careful to avoid hot splatters. Strain through a fine-mesh strainer into a bowl, pressing on the solids to extract as much purée as possible. If using as a topping, serve warm or at room temperature; chill well before swirling into ice cream. MAKE IT YOUR OWN

• Use blueberries, blackberries, or strawberries in

place of raspberries.

BLACKBERRY ICE CREAM Makes about 1 quart |

Pictured here (top scoop) When blackberries are ripe and fragrant and sitting on your counter, sometimes it’s all you can do to resist eating them as is, relishing their juicy perfection. If you have enough self-control to save some to make ice cream, though, you’ll be amply rewarded. This ice cream is wonderful sandwiched between our Dark Chocolate Cookies , or served atop a slice of pound cake with whipped cream. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week FOR THE BLACKBERRY PURÉE 2 half-pint baskets blackberries (2 cups), preferably organic ¼ to ½ cup sugar, as needed FOR THE BASE 5 large egg yolks ½ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt COOK THE BERRIES 1. Combine the berries with the sugar, using ¼ cup if they are very sweet and ½ cup if less so, in a small nonreactive saucepan and stir well. Put the pan over medium heat and cook, stirring frequently, until the berries are soft and the liquid they release has reduced somewhat,

about 10 minutes. 2. Let cool slightly, then transfer the berries and their juice to a blender or food processor. Purée until smooth. Strain half of the mixture through a fine-mesh strainer into a medium bowl, pressing on the solids to extract as much purée as possible. Discard the solids. Add the unstrained purée to the same bowl and stir once to combine. Cover the bowl and refrigerate. MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 4. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM

8. Whisk the blackberry purée into the chilled base. 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Use raspberries or a combination of blackberries

and raspberries.

• Add 1 to 2 tablespoons crème de cassis (black

currant liqueur) or bourbon as you whisk the berry purée into the base. SERVE IT WITH … • Buttermilk Ice Cream or Honey Lavender Ice Cream • Hot Fudge Sauce • Brown Sugar Graham Crackers

• Chopped Marcona almonds

Top scoop: Blackberry Ice Cream ; bottom scoop: Cherry Almond Ice Cream

R054 STRAWBERRY ICE POPS

Original source recipe evidence

STRAWBERRY ICE POPS Makes eight 3-ounce ice pops These pops are a favorite among our younger guests. We keep the ingredients simple but use a trick in the execution: we purée the strawberries and strain out most, but not all, of the seeds and solids. This produces a relatively smooth pop with just enough seeds to make it taste like real strawberries. AT A GLANCE TECHNIQUE:

Ice Pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week 3 pints strawberries (6 cups), preferably organic ½ to ¾ cup 1:1 Simple Syrup , cooled 1½ tablespoons strained fresh lemon juice 1 teaspoon balsamic vinegar (optional) MAKE THE BASE 1. Cut off and discard the tops of the berries and purée in a food processor or blender until smooth. 2. Transfer one-fourth of the mixture to a medium bowl; strain the rest of the purée through a fine-mesh strainer into the bowl, pressing on the solids to extract as much purée as possible. Add ½ cup of the simple syrup, the lemon juice, and the vinegar if using. Stir until well combined. 3. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it.

FREEZE THE POPS 4. Transfer the base to a liquid measuring cup and pour into the ice pop molds. Insert the sticks and freeze until completely solid, about 4 hours. Unmold just before serving.

R055 LIME-BLACKBERRY ICE POPS

Original source recipe evidence

LIME-BLACKBERRY ICE POPS Makes ten 3-ounce ice pops |

Pictured here Ice pops can have a variety of textures and consistencies, depending on what ingredients are in them. Fruit with more pulp creates a slightly softer consistency, whereas citrus juices and other watery bases freeze into something more solid, like these pops do. To us, there’s a place for all pops in the spectrum of frozen treats. This is one of the only instances in which we freeze berries without puréeing them first, and it’s purely for visual appeal. A pink hue emanates from the whole blackberries and permeates the rest of the pop, sort of like a watercolor painting. The result is gorgeous! This pop is a favorite of Anne’s oldest daughter Zoe. AT A GLANCE TECHNIQUE:

Ice Pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week ½ cup plus 2 tablespoons 2:1 Simple Syrup , cooled 1 cup strained fresh lime juice (from about 8 medium limes) 1 cup water ⅛ teaspoon kosher salt 1 half-pint basket blackberries (1 cup), preferably organic, berries halved if very large MAKE THE BASE

1. In a medium bowl, combine ½ cup of the simple syrup, the lime juice, water, and salt. Stir until well combined and the salt has dissolved. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE ICE POPS 3. Add 4 berries (or berry halves) to each ice pop mold. (Don’t add too many or the pops will be too icy. Leave enough room so that you end up with more juice than fruit in each pop.) 4. Transfer the base to a liquid measuring cup and pour into the ice pop molds. Insert the sticks and freeze until completely solid, about 4 hours. Unmold just before serving. MAKE IT YOUR OWN

• Use freshly squeezed lemon juice in place of lime

juice.

• Use raspberries in place of blackberries.

Raspberry Ice Pops

R056 RASPBERRY ICE POPS

Reference formulation — not released for production. Source S129, PDF pages 286–287.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

RASPBERRY ICE POPS Makes ten 3-ounce ice pops Raspberries are notoriously delicate and perishable, which is why they’re usually packed in half-pint containers (any bigger and they will collapse under their own weight). This recipe is the perfect way to preserve raspberries’ glory for a little longer. These pops are glossy and saturated with that gorgeous magenta hue. AT A GLANCE TECHNIQUE:

Ice pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week 4 half-pint baskets raspberries (4 cups), preferably organic ½ cup water ¾ cup 1:1 Simple Syrup MAKE THE BASE 1. Combine the berries, water, and ½ cup of the simple syrup in a blender or food processor and purée until smooth. Strain ½ to ¾ of the mixture (depending on how many seeds you like in your ice pops) through a fine-mesh strainer into a medium bowl, pressing on the solids to extract as much purée as possible. Discard the seeds and stir in the remaining unstrained purée. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE ICE POPS

3. Transfer the base to a liquid measuring cup and pour into the ice pop molds. Insert the sticks and freeze until completely solid, about 4 hours. Unmold just before serving.

R057 BERRY COMPOTE

Reference formulation — not released for production. Source S129, PDF pages 288–289.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BERRY COMPOTE Makes about 2 cups Berry sauces or toppings are often made by cooking the fruit until it softens and starts to break down. The textural effect can be wonderful, but the fresh flavor of the berries is diminished as they cook. Our version has the best of both worlds, featuring fresh whole raspberries bound together by a lightly sweetened purée of uncooked strawberries. This sauce is best enjoyed the same day it’s made. AT A GLANCE SHELF LIFE: 1 day 1 pint strawberries (2 cups), preferably organic 1 half-pint basket raspberries (1 cup), preferably organic ¼ cup 1:1 Simple Syrup Water, fresh lemon juice, or framboise, as needed 1. Trim and discard the tops of the strawberries. Put half of the strawberries in a blender or food processor, along with half of the raspberries. Purée until smooth, then pour through a fine-mesh strainer into a medium bowl, pressing on the solids to extract as much purée as possible. 2. Halve or quarter the remaining strawberries and add them to the purée along with the remaining raspberries and the simple syrup. Toss gently to coat. Serve chilled or at room temperature. If the mixture is too thick, thin with a few drops of water, lemon juice, or framboise. MAKE IT YOUR OWN

• You can use blackberries in place of the

strawberries or raspberries (halve them in step 2). Do not use blueberries, as they turn an unsightly gray hue when puréed.

R058 SLICED STRAWBERRY TOPPING

Reference formulation — not released for production. Source S129, PDF pages 290–292.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SLICED STRAWBERRY TOPPING Makes about 1½ cups |

Pictured here This topping, designed to showcase the texture of perfectly ripe strawberries, is chunky and light rather than thick and saucy. The optional balsamic vinegar gives it tang and depth. Make this no more than a few hours ahead of time; any longer and the berries will start to become too mushy. AT A GLANCE WAITING TIME: At least 20 minutes 1 pint strawberries (2 cups), preferably organic 2 to 3 tablespoons sugar ¼ teaspoon pure vanilla extract or seeds from ½ vanilla bean 1 teaspoon balsamic vinegar (optional) 1. Trim and discard the tops of the berries, then quarter the berries lengthwise and transfer to a medium bowl. Sprinkle with the sugar (the amount needed will depend on the sweetness of the berries), vanilla, and balsamic (if using) and toss gently to combine. 2. Let stand at least 20 minutes at room temperature to allow the sugar to dissolve. Serve chilled or at room temperature; the flavors will be stronger at room temperature.

MAKE IT YOUR OWN

• Use blackberries or raspberries in place of

strawberries (halve the blackberries; the raspberries can be left whole).

• Substitute champagne vinegar for the balsamic

vinegar.

Berry sundae with Crème Fraîche Ice Cream and Blueberry-Lemon Sauce with Lemon Gingersnaps

R059 BLUEBERRY-LEMON SAUCE

Reference formulation — not released for production. Source S129, PDF pages 293–299.

Original source recipe evidence

BLUEBERRY-LEMON SAUCE Makes about 1¼ cups This tart and tangy sauce, which features a combination of cooked and raw blueberries, couldn't be simpler. The cooked ones contribute an intense jammy flavor, and the fresh ones give that satisfying "pop" when you bite into them. AT A GLANCE SPECIAL EQUIPMENT: Microplane or other rasp grater SHELF LIFE: 1 week 1 lemon 1 pint (2 cups) blueberries, preferably organic ⅓ cup sugar 1. Working over a small nonreactive saucepan, finely grate the zest from the lemon into the pan. Juice the lemon into a bowl and set aside. 2. Add 1½ cups of the blueberries and the sugar to the pan and put over medium-high heat. Cook until most of the berries have popped and the juice they release has thickened slightly, 6 to 8 minutes. 3. Remove from the heat and stir in the remaining ½ cup of berries and the lemon juice. 4. Serve warm or at room temperature, or transfer to a container and refrigerate until ready to use. Refrigerated, the sauce will keep for up to a week, but it's best the same day it's made.

LEMON GINGERSNAPS

LEMON CURD OR SAUCE

CITRUS—AND SPECIFICALLY LEMON— was the subject of one of our first triumphs in ice cream experimentation. From the very beginning we were able to make good lemon ice cream. That wasn't the problem. Our problem was that we wanted to make really lemony ice cream. As you might guess, lemon is highly acidic, and even a moderate quantity of it will cause cream and milk to curdle. Whenever we tried upping our normal quantity of lemon juice in the ice cream recipe, the base couldn't handle the extra acid. We tried using extra lemon zest, but that didn't give use the tartness we wanted. After much trial and error, we finally figured out that lemon curd was the answer. Curd is essentially lemon juice that's stabilized in an egg custard, which keeps it from coagulating the ice cream base. At last we got the mouth- puckering, extra-lemony flavor we desired. BUYING AND USING CITRUS Citrus really shines in the wintertime, when it is abundant and at its best. It is worth seeking out interesting and unique varietals of citrus, especially cara cara oranges, moro blood oranges, pixie tangerines, bergamots, ruby grapefruits, and sweet limes. Choose citrus fruits that have shiny, taut skin and are heavy for their size. Keep them at room temperature if using within a few days, or refrigerate them in a plastic bag for longer storage.

TIP:

Although they are both called "lemons," Eureka or Lisbon lemons and Meyer lemons are actually pretty different from one another. Eurekas or Lisbons are the standard variety that you're likely to find at the grocery store. Meyer lemons are a cross between a lemon and a sweet orange; they're more aromatic, sweeter, and less acidic than standard lemons. The two types are more or less interchangeable, although you won't get as much of that true lemony tartness by using only Meyer lemons in a recipe. For that reason, several of the recipes in this chapter (primarily

those calling for more than a couple of tablespoons of lemon juice) recommend that at least a portion of the juice come from Eureka or Lisbon lemons. A handheld lever-style citrus press (the kind you often see bartenders use) is our tool of choice for squeezing citrus. It's fast, it gives the maximum yield of juice, and the squeezing action helps to release the essential oils in

the zest. Metal ones are sturdiest, but make sure they’re coated to prevent discoloration of the juice. A reamer-style juicer is the second best option. It doesn’t extract the essential oils the way the lever style juicer does, and it can start to feel tedious if you need a large quantity of juice. However, it certainly gets the job done. The outside of citrus fruits contains lots of flavor in the form of the zest. This is the thinnest outer layer of the skin containing the essential oils. These aromatic oils have a slightly floral quality not found in the juice itself. Using both the zest and the juice gives a fuller, deeper citrus flavor to whatever you’re making. For that reason, we almost always recommend using both the zest and the juice (even if the zest eventually gets strained out). A Microplane rasp grater is the best tool for grating fine tendrils of zest from citrus fruit. The flat, shallow teeth grab all the flavorful zest you want and none of the bitter pith you don’t want. Be sure to use organically grown citrus if you plan to use the zest. Even a thorough washing doesn’t remove all of the chemical residue found on sprayed fruit. You can often substitute one type of citrus for another depending on what’s available. If you make a substitution in a recipe, however, try to match the sweetness and acidity of whatever type of citrus the recipe calls for. Otherwise the final product might be too sweet or too sour. LEMON AND LIME YIELDS

1 medium (4½-ounce) lemon = 3 tablespoons juice + 1 lightly packed tablespoon finely grated zest

1 medium (3¼-ounce) lime = 2 tablespoons juice * + 2 lightly packed teaspoons finely grated zest * Limes can vary greatly in the amount of juice they will yield. Buying the heaviest ones is the best way to ensure you get enough juice, but it never hurts to buy a few extras. TIPS FOR MAXIMIZING CITRUS FLAVOR Store citrus properly. If you’re going to use the fruit within a few days, leaving it in a bowl at room temperature is fine. However, much longer than that and the skin starts to dry out and become leathery—not exactly optimal for zesting! For longer storage, put the fruit in a plastic bag in the refrigerator. Never use aluminum when working with citrus. Aluminum is a reactive metal, which means it causes acidic foods to discolor. Stainless steel or glass are your best bets if you need a heatproof container; otherwise, plastic is fine. Zest first, then juice. It’s a lot easier to juice a zested lemon than it is to zest a juiced one! It isn’t impossible to do the latter, but you’re more likely to scrape your knuckles in the process. Grate directly over the bowl you’ll be adding the zest to. Each time you draw the citrus peel over the grater, a fine mist of essential oils goes flying into the air. Working over the mixing bowl helps you capture as much of that oil as possible. Let citrus come to room temperature before juicing. The fruit will be more malleable and easier to squeeze that way. Roll citrus on the counter before juicing. This also helps soften the fruit and “pre-release” the juice for squeezing.

R060 MEYER LEMON ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 300–302.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MEYER LEMON ICE CREAM Makes about 1 quart |

Pictured here It may seem like a lot of extra work to make

lemon curd solely for the purpose of using it in ice cream, but it really is the best way to maximize lemony flavor without sacrificing texture. The curd in this recipe is similar to the lemon curd , but here we omit the butter; in ice cream, butter would be too rich and would mask the citrus flavor. You will have a little leftover curd, which you can use as a topping on ice cream, dollop onto scones, or spread on anything you want spiked with rich lemony flavor. You can make this recipe with all Eureka lemons for a tarter version of this ice cream. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine and Microplane or other rasp grater CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week FOR THE CURD 2 Meyer lemons and 1 Eureka lemon 7 large egg yolks ¾ cup sugar FOR THE ICE CREAM 5 large egg yolks ½ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt

MAKE THE LEMON CURD 1. Put about 2 inches of water in the bottom of a double boiler or medium saucepan and bring to a simmer over medium-high heat. If you are using a gas stove, make sure the flames are not coming up around the pan to prevent the curd from scorching. 2. Finely grate the zest from the lemons into the top of the double boiler or the nonreactive bowl you will be using to make your curd (you should have about 3 tablespoons). Juice the lemons and measure out ½ cup juice (if using a mix of lemon types, make sure at least one- third of the juice is from Eureka lemons). Save the rest of the juice for another use. 3. Whisk the yolks into the zest, then whisk in the ¾ cup sugar. Add the lemon juice and whisk to blend. Put the double boiler insert or bowl over but not touching the simmering water. Cook, whisking frequently until the mixture is thick and puddinglike and leaves a trail when stirred, about 10 minutes. (Check the water level periodically and add more if it threatens to boil away.) 4. When the curd has thickened, remove from the heat and pour through a fine-mesh strainer into a bowl. (Use a spatula to gently press the curd through the strainer.) Lay plastic wrap directly on the surface of the curd and refrigerate until completely chilled, about 2 hours. Meanwhile, make the ice cream base (it will need to chill for 2 hours, too). MAKE THE ICE CREAM BASE 5. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 6. In a heavy nonreactive saucepan, combine the cream, milk, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 7. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg

yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 8. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 9. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 10. Put ¾ cup of the lemon curd in a medium bowl and whisk in the chilled base a little at a time until smooth. (You won’t get as many lumps if you slowly whisk the base into the curd instead of the other way around.) 11. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH … • Lemon Gingersnaps for an ice cream sandwich • Shortbread piecrust and Meringue to make a frozen lemon meringue pie

R061 ORANGE-CARDAMOM ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 303–305.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

ORANGE-CARDAMOM ICE CREAM Makes about 1 quart We love to make this in the winter, when citrus is really doing its thing. This ice cream is unique in that it uses only the zest from the orange and none of the juice. The result is a delicate, floral citrus flavor that is a nice complement to the aromatic cardamom. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine and Microplane or other rasp grater INFUSING AND CHILLING TIME: 30 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 2 tablespoons green cardamom pods 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ teaspoon kosher salt 5 large egg yolks 1 large orange INFUSE THE MILK/CREAM 1. Put the cardamom in a small skillet and put the pan over medium heat. Toast the pods, stirring frequently, until aromatic, 2 to 3 minutes. Remove from the heat, let cool for a minute, then use a sharp knife to coarsely chop the pods.

TIP:

Cardamom pods have a tendency to fly all over the place when you chop them. To minimize this, use a sharp knife and slow, deliberate motions as you chop. Or you can crush the pods by rocking the bottom of a small sauté pan back and forth over them on a cutting board. 2. In a heavy nonreactive saucepan, stir together the cardamom, cream, milk, half of the sugar (¼ cup), and the salt. 3. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for about 30 minutes, or until the cream mixture has a distinct cardamom flavor. (Taste it to monitor the progress; the mixture will become bitter if oversteeped.) MAKE THE BASE 4. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (¼ cup). Set aside. 5. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 6. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 7. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 8. Strain the base through a fine-mesh strainer into a clean container. Zest the orange over the warm base and stir to combine. Set the container into an ice-water bath, wash your spatula, and use it to stir

the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Try another variety of orange, such as navel or

Valencia. Just make sure it has nice taut skin so that is has a full-flavored zest.

• Replace the cardamom with a cinnamon stick, a

couple of star anise, or a few Szechuan peppercorns.

• Fold chopped toasted pistachios (see

Buying and Using Nuts) into the finished ice cream. SERVE IT WITH … • Earl Grey Ice Cream or Crème Fraîche Ice Cream • Dark Chocolate Cookies to make an ice cream sandwich

R062 MANDARIN ORANGE OLIVE OIL ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 306–307.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MANDARIN ORANGE OLIVE OIL ICE CREAM Makes about 1 quart Extra-virgin olive oil adds a wonderful texture and sublime flavor to this ice cream. We like to use the organic olive oil produced by Etruria, who also make our favorite bergamot olive oil (used in Sam’s Sundae) and mandarin olive oil. You don’t have to use a flavored oil; this recipe can be made with any olive oil that you love. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ¾ cup sugar 2 cups heavy cream 1 cup 1% or 2% milk ¼ teaspoon kosher salt ¼ cup mandarin orange olive oil or other favorite olive oil MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (6 tablespoons). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt,

and the remaining sugar (6 tablespoons) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Whisk the olive oil into the chilled base until well blended. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours.

R063 PINK GRAPEFRUIT SORBET

Reference formulation — not released for production. Source S129, PDF pages 308–309.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PINK GRAPEFRUIT SORBET Makes about 1 quart |

Pictured here This is a very refreshing, tart sorbet. We call for Meyer lemon juice here simply because its extra sweetness helps balance out the tartness of the grapefruit juice. Feel free to use regular Eureka lemon juice, but you may need to use a little extra simple syrup. AT A GLANCE TECHNIQUE:

Sorbet SPECIAL EQUIPMENT: Ice cream machine SHELF LIFE: 1 week ¼ cup 2:1 Simple Syrup , cooled 3 cups fresh pink grapefruit juice (from about 6 large grapefruits) ¼ cup tapioca syrup or corn syrup 2 tablespoons strained fresh Meyer lemon juice ¼ teaspoon kosher salt MAKE THE BASE 1. In a medium nonreactive bowl, combine 2 tablespoons of the simple syrup, the grapefruit juice, tapioca syrup, lemon juice, and salt. Stir until well combined and the salt is completely dissolved. 2. Taste the base. It should taste just a bit too sweet (once the sorbet is frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE SORBET 3. Freeze in your ice cream machine according to the manufacturer’s instructions. While the sorbet is churning, put the container you’ll use

to store the sorbet into the freezer. Enjoy right away or, for a firmer sorbet, transfer to the chilled container and freeze for about 4 hours. MAKE IT YOUR OWN

• Mix the grapefruit juice with other citrus juices

such as blood orange, lemon, and/or tangerine. You can also use regular white grapefruits, but the color won’t be quite as pretty and you may need additional simple syrup, since white grapefruits are not as sweet as the pink ones. SERVE IT WITH … • Meyer Lemon Ice Cream or Tangerine Granita • Shortbread

R064 BLOOD ORANGE SORBET

Reference formulation — not released for production. Source S129, PDF pages 310–311.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BLOOD ORANGE SORBET Makes about 1 quart When they’re in season, blood oranges make many appearances at Bi-Rite Creamery. This sorbet is a favorite of ours; it has the perfect balance of acid and sweetness, with a stunning garnet hue to boot. AT A GLANCE TECHNIQUE:

Sorbet SPECIAL EQUIPMENT: Ice cream machine SHELF LIFE: 1 week ¼ cup 2:1 Simple Syrup , cooled 3½ cups fresh blood orange juice (from 10 to 12 blood oranges) ¼ cup tapioca syrup or corn syrup 2 tablespoons strained lemon juice ¼ teaspoon kosher salt MAKE THE BASE 1. In a medium nonreactive bowl, combine 2 tablespoons of the simple syrup, the orange juice, tapioca syrup, lemon juice, and salt. Stir until well combined and the salt is completely dissolved. 2. Taste the base. It should taste just a bit too sweet (once the sorbet is frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE SORBET 3. Freeze in your ice cream machine according to the manufacturer’s instructions. While the sorbet is churning, put the container you’ll use

to store the sorbet into the freezer. Enjoy right away or, for a firmer sorbet, transfer to the chilled container and freeze for about 4 hours. MAKE IT YOUR OWN

• Use other sweet citrus juices such as mandarin

orange, cara cara orange, and/or tangerine. Be sure to adjust the level of simple syrup according to the sweetness of the fruit you are using. SERVE IT WITH … • Crème Fraîche Ice Cream • Dark Chocolate Cookies

R065 TANGERINE ICE POPS

Reference formulation — not released for production. Source S129, PDF pages 312–314.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

TANGERINE ICE POPS Makes six 3-ounce ice pops This is wonderful recipe to brighten the winter doldrums. We take advantage of the many varieties of citrus available at Bi- Rite Market and change up the fruit depending on what tastes best. Our favorite combination is a mixture of Page and Satsuma tangerines, but let your taste buds guide you. Use whatever is most flavorful and in season. We always strain the mixture for the smoothest possible consistency, but feel free to skip this step if you like. AT A GLANCE TECHNIQUE: Ice pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week ½ cup 2:1 Simple Syrup , cooled 2 cups strained fresh tangerine juice (from about 12 tangerines) 3 tablespoons strained fresh lemon juice ⅛ teaspoon kosher salt MAKE THE BASE 1. In a medium nonreactive bowl, combine 6 tablespoons of the simple syrup, the tangerine and lemon juices, and the salt. Stir until well combined and the salt has dissolved. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you

need it. FREEZE THE ICE POPS 3. Strain the base through a mesh strainer into a liquid measuring cup. Pour into ice pop molds, insert the sticks, and freeze until completely solid, about 4 hours. Unmold just before serving. MAKE IT YOUR OWN

• Add a few pomegranate seeds to each pop mold.

They’re like little jewels floating in your pop!

Blood Orange Ice Pops

R066 BLOOD ORANGE ICE POPS

Reference formulation — not released for production. Source S129, PDF pages 315–317.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BLOOD ORANGE ICE POPS Makes about nine 3-ounce ice pops These pops are favorites of ours simply because they’re so beautiful. AT A GLANCE TECHNIQUES:

Ice pops , segmenting citrus SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week ½ cup 2:1 Simple Syrup , cooled 2¼ cups fresh blood orange juice (from 6 to 8 blood oranges) ⅛ teaspoon kosher salt About 30 segments of blood, cara cara, or other variety of orange MAKE THE BASE 1. In a medium nonreactive bowl, combine 6 tablespoons of the simple syrup, the juice, and the salt. Stir until well combined and the salt has dissolved. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE ICE POPS 3. Add 2 or 3 orange slices or segments to each ice pop mold. (Don’t add too many or the pops will be hard and icy. Leave room so that you end up with more juice than fruit in each pop.) 4. Strain the base through a fine-mesh strainer into a liquid measuring cup. Pour into the ice pop molds, insert the sticks, and freeze until completely solid, about 4

hours. Unmold just before serving. HOW TO MAKE CITRUS SEGMENTS

This technique is useful when you want pieces of citrus fruit that are completely free of skin and membranes— perfect for adding to ice pops, topping a sundae, or garnishing a pie. Slice the top and bottom off the fruit to expose the flesh. Set the fruit with one of the cut sides down on the cutting board. Then, working top to bottom, slice off a thin strip of the peel, removing as much of the white pith as possible. Repeat all the way around until no pith is remaining. Set the fruit on its side. Starting with the topmost segment, make two cuts just inside the membrane on either side of the segment. (For this delicate work, it helps to use a paring knife rather than a chef’s knife.) Remove the segment and repeat all the way around.

Tangerine Granita with Vanilla Ice Cream

R067 TANGERINE GRANITA

Reference formulation — not released for production. Source S129, PDF pages 318–319.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

TANGERINE GRANITA Makes about 1 quart You can use just about any kind of orange, tangerine, or mandarin orange juice in this recipe, or even use a mixture of several different kinds. AT A GLANCE TECHNIQUE:

Granita CHILLING TIME: About 3 hours SHELF LIFE: 1 week ½ cup 2:1 Simple Syrup , cooled 2¼ cups strained fresh tangerine juice (from about 14 tangerines) 2 tablespoons strained fresh lemon juice ⅛ teaspoon kosher salt MAKE THE BASE 1. In a medium nonreactive bowl, combine 6 tablespoons of the simple syrup, the tangerine and lemon juices, and the salt. Stir until well combined and the salt has dissolved. 2. Taste the base. It should taste just a bit too sweet (once the granita is

frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE GRANITA Pour the base into an 8-or 9-inch square baking dish or similar shallow pan. Freeze uncovered for 1 hour, or until ice crystals start to form. Stir the mixture with a fork to break up the crystals. Return the baking dish to the freezer and stir every 30 minutes or so to break up the ice crystals as the granita freezes. When the granita is completely frozen (2½ to 3 hours total), it should have a light, feathery texture. Serve right away or transfer to a container and store in the freezer. Break up the mixture with a fork just before serving. MAKE IT YOUR OWN

• You can use the juice of ruby grapefruits, pomelos,

or Meyer lemons in place of tangerine juice. These tarter citrus fruits will require additional sugar, so taste a bit of the base and add more simple syrup if necessary before freezing. SERVE IT WITH …

• A glass of champagne to make a mimosa float

• Vanilla Ice Cream or Whipped Cream —the bit of rich dairy is a nice counterpoint to the cool citrus

R068 CANDIED CITRUS ZEST

Reference formulation — not released for production. Source S129, PDF pages 320–321.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CANDIED CITRUS ZEST Makes about thirty 1 by 3-inch strips of zest This is the perfect thing to make whenever you have a recipe that calls for fresh squeezed citrus juice. Zest the fruit before juicing so nothing goes to waste. You can use the zest from any citrus fruit. These sugar-coated strips are a beautiful garnish for ice cream, finished cakes, or fruit tarts. Or use it in recipes: drain the zest (skip the rolling-in-sugar step), chop it, and fold into ice cream, scone doughs, or cake batter. It works wonderfully to add a bit of citrus to any recipe. AT A GLANCE WAITING AND COOLING TIME: At least 2½ hours SHELF LIFE: Nearly indefinitely when kept in syrup in the refrigerator; several weeks once rolled in sugar 3 navel oranges 1¼ cups granulated sugar 1½ cups water About ½ cup turbinado sugar or other coarse sugar, for rolling 1. Use a vegetable peeler to remove the zest from the oranges, keeping the strips as wide as possible. Or use a channel knife (the type used by bartenders to make a “twist” for your martini) instead. 2. Fill two small nonreactive saucepans with water and bring to a boil over medium-high heat. When the first one comes to a boil, add the strips of zest all at once and stir to submerge them all. When the water

comes back to a boil, drain the zest and repeat the process in the second pan. (This process reduces the amount of bitterness in the zest and helps soften it.) 3. In one of the empty saucepans, combine the granulated sugar and 1½ cups water and bring to a simmer over medium-high heat. Add the zest strips and stir to coat them evenly with the syrup. Partially cover the pan, reduce the heat to low, and cook gently until the zest is softened and appears translucent about ¼ inch in from the edge, about 1 hour. 4. Remove from the heat and let the zest cool in the syrup. If not using right away, transfer the zest and syrup to a container and refrigerate. 5. If you’re using the zest as a garnish, set a wire rack over a rimmed baking sheet. Remove the zest strips from the syrup and arrange them on the rack. Let drain for 30 minutes or so, then cut into thin strips and roll in the turbinado. Allow the zest to dry on the rack for an hour or two before using. For longer storage, transfer to an airtight container and keep at room temperature. MAKE IT YOUR OWN

• You can use almost any type of citrus in this recipe:

lemon, grapefruit, orange, pomelo, sliced kumquats … the list goes on and on!

R069 LEMON GINGERSNAPS

Reference formulation — not released for production. Source S129, PDF pages 322–324.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

LEMON GINGERSNAPS Makes about 45 cookies |

Pictured here These are some of our most popular cookies, both at the Creamery and the Market where they’re also sold. They’re more than your average gingersnap—they have classic ginger-and-molasses flavor but are brightened with lemon zest and a bit of lemon oil. A roll in turbinado sugar makes them extra sparkly and crunchy. AT A GLANCE SPECIAL EQUIPMENT: Microplane or other rasp grater CHILLING TIME: At least 2 hours or up to overnight SHELF LIFE: 1 week 4¾ cups (1 pound, 3 ounces) unbleached all-purpose flour 2 tablespoons ground ginger 2 teaspoons ground cinnamon 2 teaspoons baking soda 1 teaspoon kosher salt Finely grated zest of 2 large lemons 2 cups granulated sugar 1½ cups (12 ounces) unsalted butter, at room temperature ½ cup dark molasses 2 large eggs ¾ teaspoon lemon oil (see Note) About ¾ cup turbinado sugar, for rolling 1. In a medium bowl, whisk together the flour, ginger, cinnamon, baking

soda, salt, and zest and set aside. 2. Put the granulated sugar and butter in the bowl of a stand mixer. Beat with the paddle attachment on medium-high speed until light in color and fluffy, about 2 minutes. Add the molasses and mix until blended. Scrape down the sides of the bowl. With the motor running, add the eggs one at a time. Mix until blended, about 30 seconds. Add the lemon oil and mix again. 3. Add the flour mixture and mix on low speed just until the dough comes together, about 30 seconds. 4. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. 5. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. 6. Scoop up 2 tablespoons of dough (we use a 1-ounce ice cream scoop) and form the dough into a ball. Repeat until all the dough has been shaped. Roll the balls in the turbinado sugar and place them 2½ inches apart on the baking sheets. Flatten the balls slightly with the palm of your hand so that they’re about ½ inch thick. 7. Bake for 6 minutes, and then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies have darkened slightly in color, look dry on the surface, and the edges are slightly firm to the touch, 5 to 7 minutes longer. Let the cookies cool for a minute on the baking sheets, then transfer to a rack and let cool completely. Bake the remaining dough balls. Store the cookies in an airtight container. NOTE: Lemon oil (see Sources) gives the cookies a boost of citrusy flavor. Find it in specialty grocery stores, baking supply shops, or online. You could make the cookies without it, but it does make them

extra-lemony! SERVE IT WITH … • Pumpkin Pie Ice Cream , Brown Sugar Ice Cream with a Ginger-Caramel Swirl , or Ginger Ice Cream

R070 LEMON CURD SAUCE

Reference formulation — not released for production. Source S129, PDF pages 325–331.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

LEMON CURD or SAUCE Makes 1⅓ cups curd or up to 2⅔ cups sauce This recipe is two recipes in one! It makes a thick, rich lemon curd that’s great for scones and tarts. You can also thin it out with a little heavy cream for a mouth-puckering sauce that’s perfect for ice cream sundaes. It’s important that your butter be at room temperature. If it’s cold, it will lower the temperature of the curd and won’t blend smoothly. AT A GLANCE SPECIAL EQUIPMENT: Microplane or other rasp grater CHILLING TIME: 2 hours SHELF LIFE: 2 weeks 3 medium lemons (2 Meyer and 1 Eureka, or all Eureka) 7 large egg yolks ¾ cup sugar 6 tablespoons (3 ounces) unsalted butter, cut into ½-inch pieces, at room temperature 1 cup heavy cream, plus more as needed, if making sauce 1. Put about 2 inches of water in the bottom of a double boiler or medium saucepan and bring to a simmer over medium-high heat. If you are using a gas stove, make sure the flames are not coming up around the pan; this will scorch your lemon curd very quickly. 2. Finely grate the zest from the lemons into the top of the double boiler or the nonreactive bowl you will be using to make your curd (you should have about 3 tablespoons) and set aside. Juice the lemons and measure out ½ cup juice (if using a mix of lemon types, make sure at least one-third of the juice is from Eureka lemons). Save the rest for

another use. 3. Whisk the yolks into the zest, and then whisk in the sugar. Add the lemon juice and whisk to blend. Put the double boiler insert or bowl over but not touching the simmering water. Cook, whisking frequently, until the mixture is thick and puddinglike and leaves a trail when stirred, about 10 minutes. (Check the water level periodically and add more if it threatens to boil away.) 4. When the curd has thickened, remove from the heat and pour through a fine- mesh strainer into a bowl. (You will be straining out all of the grated zest, whose flavor is now infused in the curd itself. If you were to leave the zest in, the curd would have an odd mouthfeel.) Whisk in the butter a few pieces at a time until completely blended. Lay plastic wrap directly on the surface of the curd and refrigerate until completely chilled, about 2 hours. At this point you have a wonderful lemon curd, which you can use for a lemon tart or condiment for scones. 5. If you’d like to turn the lemon curd into a sauce, put about ½ cup of the curd in a bowl and slowly whisk in heavy cream, starting with 1 cup, to thin to your liking.

WHEN YOU APPROACH BI-RITE CREAMERY, its signature sweet aroma announces its presence well before you catch a glimpse of the storefront. The warm combo of vanilla, sugar, cream, and butter permeates the air and always makes our shop smell delicious. But it’s our recipes that use spices that really get the attention of passersby. It never fails. Whenever we are baking Evadne’s Gingerbread or anything else with dried spices, the heady scent wafts out onto the sidewalk and people poke their heads in the door to ask what’s cooking. Those sweet spicy smells are hard to ignore—or resist! For ice cream, we generally prefer to add herbs or spices to the hot cream and milk mixture, let them infuse until the desired flavor is achieved, then strain the mixture before incorporating the egg yolks. Doing it this way makes it possible to coax out the desired flavor with precision. We want a full, intense flavor, but we don’t want to let the ingredients steep so long that they overextract and

become bitter. The key to success is to taste the mixture periodically as it steeps. At first you will just taste cream, but you'll soon start to taste more and more of the herbs or spices in the cream mixture. Stop when you have an intense but not bitter flavor, remembering that the flavors will be muted somewhat once the ice cream is frozen. We give guidelines for the timing in each of the recipes that use this technique, but your taste buds are the best tool! BUYING AND USING SPICES Finding organic spices, which are now readily available, should be your first priority when shopping. So many commercially grown spices are sprayed with the toxic chemical methyl iodide, and it's not like you can wash it off the spices before using them. Buy spices in small quantities to ensure that you use them up before they go stale. Many natural food stores offer spices in bulk, allowing you to purchase as much or as little as you need. We get most of our spices

from Spicely, a company committed to growing spices in a sustainable, environmentally friendly manner. We buy their products in bulk, but their spices packaged for retail sale are widely available and ideal for the home cook: they come in small quantities (about 2 tablespoons, depending on the spice) and are packaged in an ecologically mindful way. You'll get much more flavor by buying whole spices and grinding them yourself as you need them. Almost any whole spice can easily be ground in a coffee grinder; nutmeg does best on a fine rasp grater. (Cinnamon and cloves are two spices we buy in ground form, as well as whole, because it's almost impossible to achieve a fine powder by grinding them yourself.) Store spices in individual airtight containers away from heat and light. A drawer or cabinet is best; next to or above the stove is probably the worst place to keep them! Try to use spices within six months to a year of purchase. Shelf life varies from one spice to the next, but your nose will tell you whether a spice has any punch left. If you take a whiff and can't immediately identify the spice by scent alone, toss it and refresh your supply. Whole spices have a much longer shelf life due to their minimal surface area exposed to oxygen—just one more reason to buy spices whole when you can. We frequently toast spices in order to "bloom" their flavor and aroma. This simple process of heating the spices helps to activate and release the flavors. BUYING AND USING HERBS AND OTHER FRESH AROMATICS Much of the information you just read about spices also applies to herbs and fresh aromatics like ginger. It's always best to buy organic herbs, but if they're not available, at least you have the option to wash herbs before using them. Either rinse them in cool water and pat dry, or gently wipe them off with a damp paper towel. As with spices, we typically infuse fresh herbs into our ice cream base and then strain them out. Not only do herbs like basil and mint turn

R071 BASIL ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 334–337.

Original source recipe evidence

BASIL ICE CREAM Makes about 1 quart This is the perfect recipe to try when you’re ready to venture a little off the beaten path. Most people think of basil, a cousin to mint, as a savory ingredient. However, its slight licorice flavor lends itself to sweet things, too. Make this recipe in the summer, when basil is extra fragrant and flavorful. You won’t get the same results using basil grown in a hothouse in the middle of winter. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 20 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 2 cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ teaspoon kosher salt 15 to 20 fresh basil leaves, torn or chopped fine into ⅛-inch pieces 5 large egg yolks INFUSE THE MILK/CREAM 1. In a heavy nonreactive saucepan, stir together the cream, milk, half of the sugar (¼ cup), and salt. Put the pan over medium-high heat. 2. When the mixture just begins to bubble around the edges, stir in the basil. When slight bubbling resumes around the edges of the pan, remove from the heat and cover the pan.

3. Let steep for about 20 minutes, or until the cream mixture has a distinct sweet basil flavor. (Taste it to monitor the progress; the mixture will become bitter if oversteeped.) Don’t be alarmed if the basil turns black; it won’t affect the flavor or color of the ice cream. MAKE THE BASE 4. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (¼ cup). Set aside. 5. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 6. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 7. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 8. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours.

R072 GINGER ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 338–341.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

GINGER ICE CREAM Makes about 1 quart The first time Anne had ginger ice cream she fell in love with it. It was spicy and had just the right amount of hot and cold at the same time. Topped with hot fudge sauce, it’s the perfect dessert. After experimenting with different recipes, we found that it really helps to blanch your ginger briefly before steeping it in the cream and milk. This reduces the amount of the enzyme in the ginger that can cause the dairy to curdle—but it still has plenty of flavor to infuse into the ice cream. Unlike most of our ice cream recipes, which call for 1 percent or 2 percent milk, this one uses whole milk. The additional fat offers extra insurance against curdling. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 45 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 2½ ounces fresh ginger (a knob about 5½ inches long by 1 inch wide) 2 cups heavy cream 1 cup whole milk ½ cup sugar ¼ teaspoon kosher salt 6 large egg yolks 2 tablespoons finely chopped candied ginger (optional) INFUSE THE MILK/CREAM

1. Peel the ginger and slice very thinly. Put the ginger in a nonreactive saucepan and add just enough water to cover. Put the pan over medium-high heat, bring to a boil, and boil for 1 minute. Remove from the heat, drain the ginger, and put it back in the pan. Stir in the cream, milk, half of the sugar (¼ cup), and the salt. 2. Return the pan to medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for 30 to 45 minutes, or until the cream mixture has an intense ginger flavor. (Taste it to monitor the progress; the mixture will be come bitter if oversteeped.) MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (¼ cup). Set aside. 4. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight.

FREEZE THE ICE CREAM 8. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. If using candied ginger, add it in the last minute or so of churning, or fold it in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. SERVE IT WITH …

R073 HONEY LAVENDER ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 342–344.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

HONEY LAVENDER ICE CREAM Makes about 1 quart There is no middle ground with this ice cream: people who try it either love it or hate it. Those who don’t like it say it tastes like soap. To us (and its many fans), it may smell like soap, but the flavor—a distinct lavender flavor against a honey backdrop—is a real treat. This remains one of the most popular flavors among our staff. We get our honey from Bobby Winston, a beekeeper in Sonoma County, California, who harvests his hives exclusively for us. We get 80 gallons of honey from him every year, which come to us all at once in 5-gallon buckets. It’s a wildflower blend, relatively dark and stronger in flavor than your average clover honey, with a slight molasses note. It results in a pronounced honey flavor in the finished ice cream, but you can use a lighter flavored honey for a more delicate effect. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 20 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup honey ¼ teaspoon kosher salt 2 tablespoons organic dried lavender 5 large egg yolks INFUSE THE MILK/CREAM

1. In a heavy nonreactive saucepan, stir together the cream, milk, honey, and salt. 2. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, remove from the heat and whisk in the lavender. Cover the pan and let steep for 15 to 20 minutes, or until the cream has taken on a distinct lavender flavor. (Stir it occasionally and taste it to monitor the progress.) 3. Strain through a fine-mesh strainer into a bowl, being sure to press on the lavender to extract all of the cream mixture. Rinse out the saucepan and return the infused cream to the pan. MAKE THE BASE 4. In a medium heatproof bowl, whisk the yolks just to break them up and set aside. 5. Put the pan of cream and milk over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 6. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 7. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 8. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM

9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

• Try fresh rosemary in place of the lavender. The

steeping time may vary (and too much rosemary can be an overwhelming flavor), so be sure to taste along the way. SERVE IT WITH … • Balsamic Strawberry Ice Cream • Vanilla Ice Cream , Hot Fudge Sauce , and Whipped Cream for a combo called Best Friends Sundae by Anne’s daughter Zoe and her best friend Hannah, so named because it contains each of their favorite flavors! • Hot Fudge Sauce , blood orange olive oil, and a sprinkle of Maldon sea salt (a combination developed by one of our scoopers, Josh, who named it The Dainty Gentleman)

R074 MINT CHIP ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 345–348.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MINT CHIP ICE CREAM Makes about 1 quart |

Pictured here This is the favorite flavor of Anne’s husband, Sam, who also happens to be the man behind Bi-Rite Market. It’s also one of the most popular flavors among our younger guests. We make our own chocolate chips using melted bittersweet chocolate with a tiny bit of canola oil added to it. The oil gives the chocolate a lower melting point, so the chips soften and melt in your mouth. To make the chips, we spread the melted chocolate mixture very thinly on baking sheets, freeze it, then break the hardened chocolate into small pieces. This creates thin shards that have an irresistable texture in the finished ice cream. If time is of the essence, you can use very finely chopped chocolate instead, but we feel that making our own chips gives the ice cream a really nice consistency and is definitely worth the extra step. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine and offset spatula CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup sugar 2 cups heavy cream 1 cup 1% or 2% milk ¼ teaspoon kosher salt CHOCOLATE CHIPS

4 ounces bittersweet chocolate (52% to 60% cacao), finely chopped (¾ cup) 2 teaspoons canola oil 1 teaspoon organic peppermint extract MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. WHILE THE BASE IS CHILLING, MAKE THE CHIPS 6. Line a rimmed baking sheet with parchment paper and set aside. 7. Put ½ inch of water in the bottom of a double boiler or medium saucepan and bring to a simmer over medium-high heat. If you are

using a gas stove, make sure the flames are not coming up around the pan, which can cause the chocolate to scorch. Put the chopped chocolate in the top of the double boiler or a medium heatproof bowl. Put the pan or bowl over but not touching the simmering water. Stir frequently until the chocolate is melted and completely smooth, 2 to 4 minutes. Remove from the heat and stir in the canola oil. 8. Pour the chocolate onto the prepared baking sheet and use an offset spatula to spread it into a thin, even layer. Refrigerate or freeze until hardened and brittle (30 minutes in the refrigerator, 20 minutes in the freezer). 9. When the chocolate is completely set, remove it from the refrigerator or freezer and peel it off of the parchment paper. Working quickly, break the chocolate into small pieces and put them in a bowl. (If you work too slowly, the thin chocolate will start to melt in your hands. If this happens, just return everything to the refrigerator or freezer for a few minutes to reharden.) Put the chocolate chips in the freezer until you are ready to add them to the churned ice cream. FREEZE THE ICE CREAM 10. Whisk the peppermint extract into the chilled base. 11. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the frozen chocolate chips in the last minute or so of churning, or fold them in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. MAKE IT YOUR OWN

• Substitute finely chopped candy canes for the

chocolate chips for a Christmassy delight! Sprinkle on additional chopped candy canes as a topping.

SERVE IT WITH … • Cookies and Cream Ice Cream for a kid’s dream sundae! PEPPERMINT EXTRACT

You may be surprised to see that we rely on peppermint extract for our Mint Chip Ice Cream. Practicality is the reason—it takes a lot of fresh mint to get the intensity of flavor we’re looking for, and so we use pure peppermint extract made from the plant’s essential oils. You could, of course, infuse your base with fresh mint using the technique in the Basil Ice Cream , perhaps supplementing with a drop or two of peppermint extract as needed.

R075 PEACH LEAF ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 349–350.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PEACH LEAF ICE CREAM Makes about 1 quart This recipe was inspired by the recipe for peach leaf parfait in the Chez Panisse Fruit cookbook. When you steep peach leaves in milk and cream, they impart a wonderful bitter almond flavor that is truly special. If you are lucky enough to have a peach tree in your backyard (or access to one), it’s best to pick young, tender leaves. You may also be able to find peach leaves by asking for them at your local farmers’ market. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 1¾ cups heavy cream ¾ cup 1% or 2% milk ½ cup sugar ¼ teaspoon kosher salt 10 to 12 fresh peach leaves (unsprayed or organic), rinsed and patted dry 5 large egg yolks INFUSE THE MILK/CREAM 1. In a heavy nonreactive saucepan, stir together the cream, milk, half of the sugar (¼ cup), and the salt. 2. Put the pan over medium-high heat. Crush the leaves gently in your hands to release their flavor and add them to the pan. When the mixture just begins to bubble around the edges, remove from the heat and cover the pan. Let steep for 15 to 20 minutes, or until a mellow bitter almond flavor has infused into the cream mixture. (Taste it to monitor the progress; the mixture will be come bitter if oversteeped.)

MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (¼ cup). Set aside. 4. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 8. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. SERVE IT WITH …

R076 PUMPKIN PIE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 351–353.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PUMPKIN PIE ICE CREAM Makes about 1 quart |

Pictured here This is one of our most popular holiday flavors. Every October our guests start clamoring for our pumpkin ice cream, so we put it into regular rotation around that time and keep making it through the holidays. As soon as Christmas is over, though, people begin to lose interest in it! They may ask for Balsamic Strawberry Ice Cream all year round, but nobody wants pumpkin ice cream after New Year’s. During that autumnal period when our guests are excited about this flavor, we make a seasonal sundae with this ice cream, Evadne’s Gingerbread , warm Caramel Sauce , Spiced Pecans , and Whipped Cream . The ice cream is lovely on its own as a simple finish to a holiday meal, but it’s even better with gingerbread in an ice cream cake, or with a gingersnap crust as an ice cream pie. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE 1 week 6 large egg yolks ½ teaspoon ground cinnamon ½ teaspoon ground ginger ¾ cup packed light or dark brown sugar 2 cups heavy cream

½ cup 1% or 2% milk ½ teaspoon kosher salt ¾ cup pumpkin purée (see Note) ½ teaspoon pure vanilla extract MAKE THE BASE 1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the cinnamon, ginger, and half of the brown sugar (6 tablespoons). Set aside. 2. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar (6 tablespoons) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Whisk the vanilla into the chilled base. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a

firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. NOTE: You can use canned or homemade cooked puréed pumpkin for this recipe. If you make your own purée, roast the pumpkin in the oven first to help concentrate the flavor and reduce the water content. If you use canned, be sure you get the plain variety; those labeled “pumpkin pie mix” contain sugar and spices and will throw off the recipe here.

R077 EGG NOG ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 354–357.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

EGG NOG ICE CREAM Makes about 1 quart When you think about it, egg nog is not so different from ice cream base: they both contain egg yolks, cream, and sugar, and they both benefit from a spike of booze. Our version is enriched with extra egg yolks, nutmeg, cinnamon, and just the right amount of brandy (or rum). Be sure to grate your nutmeg just before using it. You'll get a lot more flavor that way. Every year we tweak this recipe a little bit by changing the ratio of spices or using a different kind of spirit. Last year's version (shared here) was the best yet. It really does taste like egg nog and has a lovely soft consistency thanks to that bit of alcohol. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 7 large egg yolks ½ cup sugar 2 cups heavy cream ¾ cup 1% or 2% milk ½ teaspoon freshly grated nutmeg ¼ teaspoon ground cinnamon ¼ teaspoon kosher salt 2 tablespoons brandy or rum 1 teaspoon pure vanilla extract MAKE THE BASE

1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, whisk together the cream, milk, nutmeg, cinnamon, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or up to overnight. FREEZE THE ICE CREAM 6. Whisk the brandy and vanilla into the base. 7. Freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

R078 RICANELAS ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 358–360.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

RICANELAS ICE CREAM Makes about 1 quart Our ice cream maker Ezequiel came up with this flavor, which is inspired by a popular cinnamon cookie made in his hometown in Mexico. Reinvented as an ice cream, the cookie becomes a cinnamon-infused ice cream with chopped Snickerdoodles folded in. It’s one of our most popular flavors with both our guests and our staff. The only problem people seem to have with it is trying to pronounce the name! (It’s ree-cah-NELL-ahs.) AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 5 large egg yolks ½ cup sugar 2 cups heavy cream 1 cup 1% or 2% milk 1 teaspoon ground cinnamon ¼ teaspoon kosher salt 1 teaspoon pure vanilla extract 1 cup chopped Snickerdoodles , from 2 to 3 large cookies MAKE THE BASE

1. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (¼ cup). Set aside. 2. In a heavy nonreactive saucepan, whisk together the cream, milk, cinnamon, salt, and the remaining sugar (¼ cup) and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 3. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 4. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. (Don’t worry if the cinnamon still looks a little clumpy.) 5. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 6. Whisk the vanilla into the chilled base. 7. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the chopped cookies in the last minute or so of churning, or fold them in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. MAKE IT YOUR OWN

R079 APPLE PIE ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 361–364.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

APPLE PIE ICE CREAM Makes about 1 quart Our kitchen manager, Debby, came up with this ice cream. She’s big on inclusions (cookies and candies and other treats that are added to ice cream), and so she favors flavors that have lots of “stuff” in them. This re-creation of apple pie features cooked apples, brown sugar, and cinnamon, and a “crust” of cookies folded in at the end. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week FOR THE APPLES ¼ cup packed light or dark brown sugar 1 tablespoon unsalted butter 2 medium apples (pippin, Granny Smith, or other firm, tart cooking apple), peeled, cored, and cut into 1-inch chunks 1 teaspoon ground cinnamon FOR THE BASE 5 large egg yolks ⅓ cup sugar 1¾ cups heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt

1 teaspoon pure vanilla extract ½ cup chopped Snickerdoodles or sugar cookies (in pieces about ¼ inch) COOK THE APPLES 1. Combine the brown sugar and butter in a medium skillet and put the pan over medium heat. When the butter is melted and bubbly, add the apples and cinnamon. Cook, stirring frequently, until the apples are softened and most of the liquid has evaporated, 10 to 15 minutes. Remove from the heat and let cool. MAKE THE BASE 2. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in half of the sugar (about 2½ tablespoons). Set aside. 3. In a heavy nonreactive saucepan, stir together the cream, milk, salt, and the remaining sugar and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 4. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 5. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 6. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base

for at least 2 hours or overnight. FREEZE THE ICE CREAM 7. Combine the purée with the vanilla and half of the chilled base in a blender or food processor. Purée until smooth. 8. Combine the puréed mixture and the remaining base and freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Add the chopped cookies in the last minute or so of churning, or fold them in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours. SERVE IT WITH … • Pumpkin Pie Ice Cream , Brown Sugar Ice Cream with a Ginger-Caramel Swirl , or Salted Caramel Ice Cream

• A drizzle of

Caramel Sauce

Picante Galia Melon Ice Pops

R080 PICANTE GALIA MELON ICE POPS

Reference formulation — not released for production. Source S129, PDF pages 365–366.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

PICANTE GALIA MELON ICE POPS Makes eight 3-ounce ice pops Kris says, “I always look forward to this refreshing, summery pop. It reminds me of vacations in Mexico, where I’ve been served pieces of melon or mango sprinkled with lime, salt, and cayenne pepper. At the beach and with a nice cold beer in hand, I could eat that spicy fruit all day long!” AT A GLANCE TECHNIQUE:

Ice pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week 1 small Galia melon (about 2¼ pounds), peeled, seeded and cut into chunks ½ cup 1:1 Simple Syrup , cooled 2 tablespoons fresh strained lime juice ¼ teaspoon kosher salt ⅛ teaspoon cayenne pepper MAKE THE BASE 1. In a food processor or blender, purée the melon until smooth. Strain through a fine-mesh strainer into a medium bowl. Add 6 tablespoons of the simple syrup, the lime juice, salt, and cayenne. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you

need it. FREEZE THE ICE POPS 3. Transfer the base to a liquid measuring cup and pour into the ice pop molds. Insert the sticks and freeze until completely solid, about 4 hours. Unmold just before serving. MAKE IT YOUR OWN

• We like to use Galia melon, which looks like a

cross between a cantaloupe and a honeydew. However, you could use almost any variety of melon in its place.

R081 EVADNE’S GINGERBREAD

Reference formulation — not released for production. Source S129, PDF pages 367–370.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

EVADNE’S GINGERBREAD Makes two 8-inch cakes (enough for two ice cream cakes) or about 16 cupcakes |

Pictured here Anne says, “This recipe came to me from my dear friend and co- worker Shannan Hobbs. She got it from her Great Granny Tatum, who was a housewife in the 1920s. In those days, apparently it was common for authors to sprinkle recipes throughout novels that were targeted to women, thus ensuring that a housewife’s time was always well spent. Great Granny Tatum discovered this recipe in a novel in which the main character, named Evadne, goes to the kitchen and whips up gingerbread. The recipe has been in Shannan’s family ever since.” This simple, versatile cake can be layered with lemon curd and buttercream as a layer cake or made into cupcakes and topped with cream cheese frosting. During the holidays, we use this gingerbread as the bottom layer in our pumpkin ice cream cake. AT A GLANCE SPECIAL EQUIPMENT: Two round cake pans, 8 inches in diameter and 3 inches deep, or two standard muffin pans COOLING TIME: 1 to 2 hours SHELF LIFE: 5 days Nonstick cooking spray or unsalted butter, for the cake pan 2 cups (9 ounces) unbleached all-purpose flour 2 teaspoons baking soda 1 teaspoon ground cloves 1 teaspoon ground ginger 1 teaspoon ground cinnamon 1 teaspoon kosher salt

1 cup canola or other neutral-flavored oil ¾ cup plus 2 tablespoons sugar ½ cup dark molasses 3 large eggs 1 cup boiling water 1. If making cakes, position a rack in the center of the oven; if making cupcakes, position racks in the upper third and lower third of the oven. Preheat the oven to 350°F. If making cakes, spray or butter two round cake pans, each 8 inches in diamter and 3 inches deep, and line the bottoms with parchment paper. If making cupcakes, line sixteen cups of two standard muffin tins with paper or foil liners. 2. In a medium bowl, whisk together the flour, baking soda, cloves, ginger, cinnamon, and salt and set aside. 3. In the bowl of a stand mixer with the paddle attachment, combine the oil, sugar, and molasses. Mix on medium speed until blended, 15 seconds. With the motor running, add the eggs one at a time, completely mixing in each egg before adding the next. Scrape down the sides of the bowl, add the flour mixture, and mix on low speed just until combined, about 30 seconds. Add the boiling water and mix on low speed just until blended. 4. Divide the batter between the cake pans or among the muffin cups (each cup should be about three-quarters full). Bake until the cakes spring back to a light touch and a toothpick inserted into the center comes out clean, 25 to 30 minutes for the cakes and 15 to 20 minutes for cupcakes. 5. Let the cakes cool in the pans for 45 minutes, then invert onto a wire rack. Remove the parchment and let cool completely. Let the cupcakes cool in the pans for 30 minutes before transferring to a wire rack, then let cool completely. NOTE: A stand mixer isn’t essential to the success of this recipe; you can also mix it by hand, which is

probably how Great Granny Tatum did it! SERVE IT WITH … • Lemon Curd Sauce and Whipped Cream • Meyer Lemon Ice Cream , Ginger Ice Cream , Ricanelas Ice Cream , or Honey Lavender Ice Cream

Ice cream cake with Evadne’s Gingerbread , Pumpkin Pie Ice Cream , and Caramel Sauce

R082 SNICKERDOODLES

Reference formulation — not released for production. Source S129, PDF pages 371–377.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

SNICKERDOODLES Makes about 30 cookies Snickerdoodles, for the uninitiated, are basically sugar cookies that get a dusting of cinnamon-sugar before baking. If you're making these to use them in Ricanelas Ice Cream , try baking them just a bit darker than you normally would. This helps ensure they stay crunchy once mixed into the ice cream. AT A GLANCE CHILLING AND COOLING TIME: At least 2 hours or up to overnight SHELF LIFE: 5 days 2 cups (9 ounces) unbleached all-purpose flour 2 teaspoons cream of tartar 1 teaspoon baking soda ½ teaspoon kosher salt 1 cup (8 ounces) unsalted butter, at room temperature 1½ cups sugar 2 large eggs FOR ROLLING 1 tablespoon ground cinnamon ¼ cup sugar 1. In a medium bowl, whisk together the flour, cream of tartar, baking soda, and salt and set aside.

2. In the bowl of a stand mixer with the paddle attachment, combine the butter and 1½ cups sugar. Mix on medium-high speed until lightened in color and fluffy, about 2 minutes. Scrape down the bowl. With the motor running, add the eggs one at a time, completely mixing in each egg in before adding the next. Scrape down the sides of the bowl, add the flour mixture, and mix on low speed just until the dough comes together, about 30 seconds. 3. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. 4. When you're ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper or nonstick mats. In a small bowl, mix the cinnamon and ¼ cup of sugar. Scoop up 2 tablespoons of dough (we use a 1-ounce ice cream scoop) and form the dough into a ball. Repeat until all the dough has been shaped. Toss the dough balls in the cinnamon-sugar mixture and space them at least 3 inches apart on the baking sheets (they spread a lot during baking). 5. Bake for 5 minutes, then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies are golden brown on the edges, 7 to 9 minutes longer. (If you plan to use a few in the Ricanelas Ice Cream , bake them until golden brown in the center, 2 minutes extra.) Let cool for 5 minutes on the baking sheets, then transfer to a cooling rack. Bake the remaining dough balls. Let cool completely. Store in an airtight container.

TROPICAL FRUITS TOASTED COCONUT ICE CREAM

MANGO SAUCE

CARAMELIZED BANANA ICE CREAM

CHOCOLATE COCONUT "ICE CREAM"

MANGO SORBET

PINEAPPLE-MINT ICE POPS

BANANAS BRÛLÉE

COCONUT MACAROONS

WE MAKE EVERY EFFORT to use local and seasonal fruits in our ice creams and treats, but we do make a few exceptions for tropical fruits that simply won't grow in Northern California. (Don't let all the palm trees that we have in San Francisco fool you!) How could we call ourselves an ice cream shop if we didn't offer banana splits? We also make an exception for mangoes, which are delectable on their own but become even more luscious and amazing as a sorbet. Even though these fruits don't grow nearby, we do everything we can to source organically grown fruit from producers who are taking care of their land. COCONUTS For convenience, we use dried organic coconut and canned organic coconut milk in our bakery recipes. Little is lost in the path from whole coconut to these shelf-stable forms; they still provide great coconut flavor, and they're a lot easier to deal with than fresh coconut. For ice creams and baked goods, we use dried shredded coconut (in fine wisps measuring 1⁄16 inch to ⅛ inch) in sweetened and⁄or unsweetened forms, depending on the desired effect. The one exception is our granola , which uses flaked dried coconut (about ¼ inch wide) for extra crunch. Unsweetened dried coconut provides pure coconut flavor and gives us more control over how much sugar we're adding to the mix; we use it anytime we want to infuse a liquid, such as when we're making our coconut ice cream base, or when it's the main ingredient, as in our macaroons. Most natural foods stores carry unsweetened dried coconut. We use sweetened dried coconut for "finishing" items, like sprinkling over a cake or mixing into churned ice cream. The sugar gives the coconut a more pleasant texture and

mouthfeel. We always toast our coconut before using it to intensify and enhance its flavor. You can do this on the stove top (more energy efficient) or in the oven (more foolproof).

•

Oven method. Position a rack in the center of the oven and preheat the oven to 350°F. Spread the coconut on a rimmed baking sheet and bake, stirring every 2 minutes, until golden brown, 4 to 6 minutes total. •

Stove top method. Put the coconut in a dry skillet and put the pan over medium heat. Stir constantly to prevent burning and toast until golden brown, about 4 minutes. We use canned coconut milk in a few recipes, most notably in our Chocolate Coconut “Ice Cream” . Use organic if you can find it, but whatever you do, don’t use “lite” because the reduced fat will produce disappointing results. PINEAPPLES One great thing about pineapples is that they continue to ripen after picking, so even if you can only find green ones at the grocery store, it will eventually reach ripe perfection at home. Leave it on your counter to ripen (at the creamery we just leave them in their crates, stacked up in our hallway!). Pay attention to the pineapple in the days that follow: it will turn more golden or yellow as it ripens, and it will start to have a bit of “give” when you squeeze it (too much give means it’s overripe). The true test is to smell the base. When it has a heady, floral aroma, it’s ready to use. To trim and dice a pineapple, first grab the leafy top and twist it until it comes off. (You can compost the top, or plant it in the ground to grow your own pineapple plant.) Slice about ½ inch off of the top and bottom of the fruit to expose the flesh and create a more stable base. Set the pineapple on one of the cut ends and slice down to remove a strip of rind, following the natural curvature of the fruit. Repeat all the way around. If you’re making ice pops or sorbet, don’t worry if some of the “eyes” remain in the fruit (they’ll get strained out anyway), but if you’re serving the fruit as is, you can use a paring knife to remove the eyes. Then, quarter the fruit lengthwise and trim the fibrous core from the center of each wedge. Compost or discard the rinds and core. Halve each wedge lengthwise, and then cut crosswise into chunks.

R083 TOASTED COCONUT ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 379–381.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

TOASTED COCONUT ICE CREAM Makes about 1 quart We use two different types of toasted coconut in this ice cream: unsweetened coconut steeps with the milk and cream to impart a full coconut flavor without added sugar, and sweetened coconut is folded into the finished ice cream for just a bit of texture and crunch. We've found that using unsweetened coconut at the end doesn't give the ice cream the same delicate bite. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine INFUSING AND CHILLING TIME: 20 minutes, plus 2 hours or overnight SHELF LIFE: 1 week 1 cup unsweetened dried shredded coconut ¼ cup sweetened dried shredded coconut 2 cups heavy cream 1¼ cups 1% or 2% milk ¾ cup sugar ¼ teaspoon kosher salt 5 large egg yolks TOAST THE COCONUT

1. Position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. 2. Spread the unsweetened coconut on a small rimmed baking sheet, and spread the sweetened coconut on another small rimmed baking sheet. Put them both in the oven and toast, stirring every 2 minutes, until golden brown, 4 to 6 minutes total. Alternatively, you can toast the coconut on the stove top in a dry skillet over medium heat. Toast the two types separately, and stir constantly to prevent burning. This is a faster and more energy- efficient method, but it requires constant attention and does not toast the coconut quite as evenly. INFUSE THE MILK/CREAM 3. In a heavy nonreactive saucepan, stir together the cream, milk, half of the sugar (6 tablespoons), and the salt. 4. Put the pan over medium-high heat. When the mixture just begins to bubble around the edges, stir in the unsweetened coconut. When slight bubbling resumes around the edges of the pan, remove from the heat and cover the pan. Let steep for 15 to 20 minutes, or until a distinct coconut flavor has infused into the liquid. (Taste it to monitor the progress.) 5. Strain through a fine-mesh strainer into a bowl, pressing on the coconut to extract as much liquid as possible. Rinse the pan, then return the infused cream to the saucepan. MAKE THE BASE 6. In a medium heatproof bowl, whisk the yolks just to break them up, then whisk in the remaining sugar (6 tablespoons). Set aside. 7. Uncover the cream mixture and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 8. Carefully scoop out about ½ cup of the hot cream mixture and,

whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 9. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 10. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM 11. Freeze in your ice cream machine according to the manufacturer's instructions. While the ice cream is churning, put the container you'll use to store the ice cream into the freezer. Add the sweetened coconut in the last minute or so of churning, or fold it in by hand after transferring the ice cream to the chilled container. Enjoy right away or, for a firmer ice cream, freeze for at least 4 hours.

R084 MANGO SAUCE

Reference formulation — not released for production. Source S129, PDF pages 382–382.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MANGO SAUCE Makes about 2 ½ cups This flavorful sauce adds a sweet–tart note and a hit of color to ice cream, cakes, and other desserts. AT A GLANCE SPECIAL EQUIPMENT: Blender or food processor SHELF LIFE: 2 days 2 large or 3 medium ripe mangoes, peeled, pitted, and cut into chunks 2 tablespoons strained fresh lime juice ⅛ teaspoon kosher salt ½ cup 1:1 Simple Syrup , cooled 1. Put the mangoes in a blender or food processor and purée until smooth. Strain through a fine-mesh strainer into a medium bowl, pressing on the solids to extract as much of the purée as possible. Stir in the lime juice and salt. Add ¼ cup simple syrup; taste and add more if needed. Chill before serving.

R085 CARAMELIZED BANANA ICE CREAM

Reference formulation — not released for production. Source S129, PDF pages 383–385.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CARAMELIZED BANANA ICE CREAM Makes about 1 quart |

Pictured here In order to bring out the most intense banana flavor possible, we cook very ripe bananas with brown sugar until they’re caramelized and bubbly. This reduces the water content, intensifies the banana flavor, and brings out the sweetness of the fruit. In this recipe especially, the riper your bananas, the better and more flavorful your ice cream will be. At the Creamery, we wait until they are almost black before using them! The optional rum gives the ice cream a real Bananas Foster–type flavor. AT A GLANCE TECHNIQUE:

Ice cream SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: 2 hours or overnight SHELF LIFE: 1 week 2 very ripe medium bananas, peeled ½ cup packed light or dark brown sugar 5 large egg yolks 1¾ cup heavy cream ¾ cup 1% or 2% milk ¼ teaspoon kosher salt 1 to 2 tablespoons dark rum (optional) 1 teaspoon pure vanilla extract

CARAMELIZE THE BANANAS 1. Combine the bananas and brown sugar in medium skillet and use a fork to smoosh them together into a nearly liquid paste. Put the pan over medium heat and cook, stirring frequently, until the mixture is dark golden brown and slightly reduced, 5 to 7 minutes. 2. Let cool briefly, then purée in a blender or food processor to make a smooth paste. Set aside. MAKE THE BASE 3. In a medium heatproof bowl, whisk the yolks just to break them up. Set aside. 4. In a heavy nonreactive saucepan, stir together the cream, milk, and salt and put the pan over medium-high heat. When the mixture approaches a bare simmer, reduce the heat to medium. 5. Carefully scoop out about ½ cup of the hot cream mixture and, whisking the eggs constantly, add the cream to the bowl with the egg yolks. Repeat, adding another ½ cup of the hot cream to the bowl with the yolks. Using a heatproof rubber spatula, stir the cream in the saucepan as you slowly pour the egg-and-cream mixture from the bowl into the pan. 6. Cook the mixture carefully over medium heat, stirring constantly, until it is thickened, coats the back of a spatula, and holds a clear path when you run your finger across the spatula, 1 to 2 minutes longer. 7. Strain the base through a fine-mesh strainer into a clean container. Set the container into an ice-water bath, wash your spatula, and use it to stir the base occasionally until it is cool. Remove the container from the ice-water bath, cover with plastic wrap, and refrigerate the base for at least 2 hours or overnight. FREEZE THE ICE CREAM

8. Add the rum (if using) and vanilla extract to the base and stir until blended. 9. Freeze in your ice cream machine according to the manufacturer’s instructions. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for at least 4 hours. MAKE IT YOUR OWN

Buying and Using Nuts) and finely chopped bittersweet chocolate. SERVE IT WITH … • Salted Caramel Ice Cream or Balsamic Strawberry Ice Cream • Caramel Sauce , Whipped Cream , and Brown Sugar Graham Crackers to make our Afternoon Snack sundae

R086 CHOCOLATE COCONUT “ICE CREAM”

Reference formulation — not released for production. Source S129, PDF pages 386–387.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

CHOCOLATE COCONUT “ICE CREAM” Makes about 1 quart When we first opened our ice cream shop, our vegan (dairy-free) ice cream was made with soy milk and silken tofu. It was good, but not great, and it lacked the rich creaminess of our dairy-based ice creams. Then it occurred to us: coconut milk! It has plenty of fat for a creamy mouthfeel, and the coconut flavor is a terrific pairing for chocolate. Don’t be tempted to use “lite” coconut milk; the full amount of fat is essential for delicious results. AT A GLANCE TECHNIQUE:

Sorbet SPECIAL EQUIPMENT: Ice cream machine CHILLING TIME: At least 1 hour or up to overnight SHELF LIFE: 1 week 2 cans (13.5 ounces each) coconut milk ¾ cup sugar 2 ounces (½ cup plus 1 tablespoon) cocoa powder, measured then sifted ¼ cup tapioca syrup or corn syrup ½ teaspoon kosher salt ½ teaspoon pure vanilla extract MAKE THE BASE 1. Combine all of the ingredients in a blender or food processor and purée until blended and smooth. 2. Transfer to a container, cover, and refrigerate for at least 1 hour, or up to overnight. FREEZE THE ICE CREAM

3. Freeze in your ice cream machine according to the manufacturer’s instructions, being careful not to overchurn. While the ice cream is churning, put the container you’ll use to store the ice cream into the freezer. Enjoy right away or, for a firmer ice cream, transfer to the chilled container and freeze for about 4 hours. MAKE IT YOUR OWN

Reference formulation — not released for production. Source S129, PDF pages 388–389.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

MANGO SORBET Makes about 1 quart |

Pictured here Fresh mangoes have a uniquely luscious texture that becomes very fine and smooth with puréeing, which makes them particularly well suited to sorbet. The addition of a bit of tapioca syrup helps make the sorbet extra creamy when frozen. AT A GLANCE TECHNIQUE:

Sorbet SPECIAL EQUIPMENT: Ice cream machine SHELF LIFE: 1 week 3 large ripe mangoes (about 3 pounds total) 6 tablespoons water 6 tablespoons tapioca syrup or corn syrup 3 tablespoons strained fresh lime juice ¼ teaspoon kosher salt ½ cup 1:1 Simple Syrup MAKE THE BASE 1. Peel the mangoes, cut the flesh away from the pits, and cut the fruit into chunks (see the section on Mangoes for detailed instructions). Purée in a blender or food processor until smooth. Strain into a medium bowl, pressing on the solids to extract as much liquid as possible.

2. Add the water, tapioca syrup, lime juice, salt, and ½ cup of the simple syrup to the strained purée. Whisk until well combined and the salt is completely dissolved. 3. Taste the base. It should taste just a bit too sweet (once the sorbet is frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE SORBET 4. Freeze in your ice cream machine according to the manufacturer’s instructions. While the sorbet is churning, put the container you’ll use to store the sorbet into the freezer. Enjoy right away or, for a firmer sorbet, transfer to the chilled container and freeze for about 4 hours. MAKE IT YOUR OWN

• This recipe can easily be made with other fruit,

such as nectarines (as shown on the cover). Use 3 pounds of nectarines (about 6 large nectarines), pitted and cut into chunks. Purée the fruit, then combine with the other ingredients as directed (no need to strain). Just use lemon juice instead of lime juice. SERVE IT WITH … • Toasted Coconut Ice Cream or Crème Fraîche Ice Cream

Original source recipe evidence

PINEAPPLE-MINT ICE POPS Makes nine 3-ounce ice pops |

Pictured here The heady, sweet pineapple in these beautiful and refreshing pops is a perfect foil for the gentle brace of fresh mint. AT A GLANCE TECHNIQUE:

Ice pops SPECIAL EQUIPMENT: Ice pop molds CHILLING TIME: At least 4 hours SHELF LIFE: 1 week 1 large ripe pineapple (about 3½ pounds), peeled, cored, and cut into chunks ⅓ cup lightly packed coarsely chopped fresh mint leaves ½ cup 1:1 Simple Syrup , cooled Juice of 1 small lime, strained ⅛ teaspoon salt MAKE THE BASE 1. In a food processor or blender, purée the pineapple and mint just until smooth. (Avoid processing any longer than necessary, as it will make the mixture too frothy.) Strain through a fine-mesh strainer into a medium bowl, pressing on the solids to extract as much juice as possible. Add half of the simple syrup, the lime juice, and salt and whisk to blend. 2. Taste the base. It should taste just a bit too sweet (once frozen, it will lose some of its sweetness). Add the remaining simple syrup if you need it. FREEZE THE ICE POPS

3. Transfer the base to a liquid measuring cup and pour into ice pop molds. Insert the sticks and freeze until completely solid, about 4 hours. Unmold just before serving. MAKE IT YOUR OWN

• Add 1 tablespoon light rum or tequila for an adults-

only spin on a tropical cocktail! Don’t be tempted to add more than 1 tablespoon, though, as it will prevent the pops from freezing properly.

R089 BANANAS BRÛLÉE

Reference formulation — not released for production. Source S129, PDF pages 392–394.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

BANANAS BRÛLÉE Makes 2 banana halves, for 1 banana split These bananas are the secret to the best banana split you'll ever have. A propane or butane kitchen torch (the kind you'd use to make crème brûlée) is the best tool for the job. You can use your broiler instead, but the bananas will not caramelize nearly as evenly. Use bananas that are ripe but not super soft; very ripe ones are too delicate and will fall apart when you move them. This is one recipe where conventional (not organic) sugar works best because organic sugar does not melt evenly and has a tendency to burn. Make these at the very last minute possible, as the caramelized sugar will start to dissolve and melt very quickly. AT A GLANCE SPECIAL EQUIPMENT: Brûlée torch SHELF LIFE: Use immediately 1 medium-ripe banana 1½ to 2 tablespoons sugar 1. Halve the banana lengthwise and peel off the skin. Place the banana halves cut side up on a flameproof surface such as a baking sheet set on a few layers of kitchen towels. Sprinkle the sugar evenly over the bananas and use the back of a spoon to smooth the sugar evenly over the surface. 2. Light your torch and wave it back and forth over the sugar. It's important to keep the flame in constant motion to avoid burned spots. Continue until the sugar is melted and caramelized.

3. Let cool for a few seconds to let the sugar harden, then use a spatula to transfer the bananas to a serving dish. Serve right away.

Front left: Coconut Macaroons with Chocolate Ice Cream ; front right: Dark Chocolate Cookies with Balsamic Strawberry Ice Cream

R090 COCONUT MACAROONS

Reference formulation — not released for production. Source S129, PDF pages 395–400.

Review decision: Household cup/spoon/egg measures and cream composition need weighing. Frozen-base treatment, post-process additions and storage require commercial qualification; do not inherit domestic shelf-life or nutritional claims.

Original source recipe evidence

COCONUT MACAROONS Makes about 20 cookies These cookies, which we make year-round, have many loyal fans at Bi-Rite Market and the Creamery alike. You can bake these cookies in the traditional mound shapes, or flatten them out for use in ice cream sandwiches. In addition to being pretty and delicious, they’re also a good option for those avoiding wheat. AT A GLANCE CHILLING TIME: At least 2 hours or up to overnight SHELF LIFE: 1 week 1 cup sugar ½ cup egg whites (from about 4 large eggs) 2 tablespoons tapioca syrup or corn syrup 1 teaspoon pure vanilla extract ¼ teaspoon kosher salt 3 cups (8 ounces) finely shredded unsweetened coconut (organic, if possible) 1. Put about ½ inch of water in the bottom of a double boiler or medium saucepan and bring to a simmer over medium-high heat. 2. In the top of the double boiler or in a medium nonreactive bowl, whisk together all of the ingredients except the coconut. Put the double boiler insert or bowl over but not touching the simmering water. Cook, whisking frequently, until the mixture becomes somewhat translucent but still has some visible granules of sugar

(about ¾ of the sugar should be dissolved), 2 to 3 minutes. 3. Remove from the heat and stir in the coconut. Cover the bowl with plastic wrap and chill until the dough is firm, at least 2 hours or up to overnight. (This is a very sticky dough even after it is chilled thoroughly, but it will firm up quite a bit in the refrigerator.) 4. When you’re ready to bake, position racks in the top and bottom thirds of the oven and preheat the oven to 350°F. Line two baking sheets with parchment paper. Scoop up 2 tablespoons of dough and form it into a ball. Repeat until all the dough has been shaped. For traditionally shaped (mounded) macaroons, space the balls 2 inches apart on the baking sheets and leave them as is. For flat cookies that can be used for ice cream sandwiches, space the balls 3 inches apart and use water-dipped fingertips to flatten them until they are about 3 inches in diameter and ¼ inch thick. 5. Bake for 10 minutes, and then rotate the baking sheets top to bottom and front to back. Continue to bake until the cookies are golden brown on top, about 5 minutes longer for flattened cookies and about 10 minutes longer for rounded cookies. 6. When the cookies come out of the oven, slide the sheet of parchment, cookies and all, onto a cooling rack. Let the cookies cool completely before peeling them off of the parchment (otherwise they will fall apart). Line the baking sheet with another sheet of parchment and bake any remaining dough.

ACKNOWLEDGMENTS WE HAVE SO MANY PEOPLE to thank for helping to make this book a reality! Thanks to our personable, friendly, and talented staff at Bi-Rite Creamery: the baking team, Debby, Matt, Natalie, Olivia, and Coral; ice cream makers Ezequiel and Luis; the Cream Team scoopers (that’s what they call themselves!), Raul, Josh, Jacqi, Andrea, Daniel, Katie, Elisa, Priscilla, Mercedes, Surya, Laura, Emily, and Celina; the prep⁄dish boys, Selvin, Juan Carlos, Denis, Rodolfo, Tony, and Rudy; and the bakers’ helpers, Javier and Trini. Many thanks to Sam Mogannan and Calvin Tsay, our wonderful business partners,

for their great advice and constant support. Thanks are also due to the staff at our sister company, Bi-Rite Market, especially Liz Martinez, for all her knowledge and invaluable help; Simon Richard, for letting us know about the freshest and best-tasting produce; Kirsten Bourne, for her tireless marketing help; and Mary and John Thompson, for making sure our vendors and staff get paid on time. Thanks also to our mentors Patrick Delessio, Rodney Cerdan, and Shannan Hobbs. If you own an ice cream shop, the best person to know is a refrigeration/freezer repair guy. Dave Cava, from Central Refrigeration, is our man! He is always willing to take a phone call from us and come to our rescue. We're also grateful to Steve Thompson at Emery Thompson and everyone at Straus Family Creamery, especially Albert Straus and Anna Kharbas. We're grateful to our agent, Katherine Cowles, who helped us hone our idea and guide us through the writing and publishing process, and to the entire staff at Ten Speed, especially Aaron Wehner, Melissa Moore, Nancy Austin, Katy Brown, and Kristin Casemore. To our neighbors along (and above) 18th Street, thank you for your

R143 1. Recette : Glace Classique à la Vanille (arôme)

Reference formulation — not released for production. Source S020, PDF page 7 through PDF page 8.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Cette recette de glace à la vanille, douce et parfumée, a été ajustée pour que la quantité de sucre en poudre soit de 500g (1/2 kg) et le lait en poudre à 250g . Cela vous permettra de produire environ 3 litres de cette délicieuse douceur, avec une texture onctueuse et une saveur équilibrée. Les jaunes d'œufs restent optionnels pour s'adapter à vos préférences. Ingrédients (pour environ 3 litres de glace) ● Eau : 2000 g (ml) ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Stabilisateur pour glace : 12,5 g (vous pouvez arrondir à 12 ou 13g) ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme vanille (liquide) : 20 ml (environ 4 cuillères à café) ● Colorant en poudre (facultatif, pour une légère teinte) : 1,25 g (une bonne pointe de couteau, ou ajustez pour la couleur désirée) Préparation Étape par Étape 1. Mélange des ingrédients secs : Dans un grand saladier, mélangez soigneusement le lait en poudre entier , le sucre en poudre et le stabilisateur pour glace . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes d'œufs (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Création de la base liquide : Dans une grande marmite, versez l' eau . Ajoutez progressivement le mélange de poudres sèches (lait en poudre, sucre, stabilisateur) à l'eau, en remuant constamment avec un fouet pour dissoudre les poudres et obtenir une base homogène. 4. Chauffage doux et incorporation des œufs (si utilisés) : Si vous avez utilisé les jaunes d'œufs, faites chauffer cette base liquide à feu doux, en remuant régulièrement. Lorsque le mélange est tiède (environ 40-50°C, juste chaud au toucher), retirez-le du feu. Incorporez une petite quantité de cette base chaude aux jaunes d'œufs battus pour les tempérer. Versez ensuite ce mélange jaunes-base dans la marmite, en remuant continuellement. Si vous n'avez pas utilisé les jaunes, continuez à l'étape 5. 5. Cuisson de la crème (si les jaunes d'œufs sont utilisés) : Si vous avez incorporé les jaunes d'œufs, remettez la marmite sur feu doux et continuez de SALEUXL87B5GTR5G0H2 remuer avec une cuillère en bois. Faites chauffer la crème jusqu'à ce qu'elle épaississe légèrement et nappe la cuillère (environ 80-85°C). Ne laissez pas bouillir ! Cette étape pasteurise les œufs et améliore la texture. Si vous n'avez pas utilisé les jaunes, cette étape n'est pas nécessaire ; assurez-vous simplement que les poudres sont bien dissoutes. 6. Ajout de la vanille et du colorant : Retirez du feu (si vous étiez en train de chauffer). Incorporez l' essence d'arôme vanille et le colorant en poudre (si utilisé). Mélangez bien. 7. Refroidissement rapide et maturation : Pour un refroidissement rapide et éviter la formation de gros cristaux de glace, vous pouvez placer la marmite dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps. Une fois à température ambiante, couvrez la marmite et placez-la au réfrigérateur pendant au moins 4 à 6 heures , ou idéalement toute une nuit. Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Turbinage (avec une machine à glace italienne) : Une fois la base bien froide et mature, versez-la dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 9. Surgélation : Transférez la glace turbinée dans des bacs ou des moules à bâtonnets et placez-les au congélateur pour qu'ils durcissent complètement, pendant au moins 2 à 4 heures.

Conseils Spécifiques ● Qualité des ingrédients : L'utilisation de lait en poudre de bonne qualité et d'une essence de vanille concentrée fera une grande différence pour le goût. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les utiliser pour éviter un choc thermique. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue. Profitez de votre délicieuse glace à la vanille faite maison ! SALEUXL87B5GTR5G0H2

R144 2. Recette : Glace Classique au Chocolat (arôme)

Reference formulation — not released for production. Source S020, PDF page 9 through PDF page 11.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Original source recipe evidence

Cette recette de glace au chocolat, riche et onctueuse, vous permettra de produire environ 2,5 litres de cette délicieuse douceur, avec une texture parfaite grâce à un équilibre optimal des ingrédients. Les jaunes d'œufs restent optionnels selon votre préférence. Ingrédients (pour environ 2,5 litres de glace) ● Eau : 1500 g (ml) ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Poudre de cacao non sucrée : 125 g ● Stabilisateur pour glace : 10 g ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme chocolat (liquide) : 10 ml (environ 2 cuillères à café) - facultatif, pour accentuer le goût ● Pincée de sel : 1 g (pour rehausser les saveurs) Préparation Étape par Étape 1. Mélange des poudres : Dans un grand saladier, mélangez très soigneusement le sucre en poudre , le lait en poudre entier , la poudre de cacao , le stabilisateur pour glace et la pincée de sel . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes d'œufs (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Chauffage de l'eau et incorporation des poudres : Dans une grande marmite, versez l' eau . Faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. Le cacao peut être un peu plus difficile à dissoudre, soyez patient et continuez de fouetter. 4. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la marmite. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 5. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la marmite sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne SALEUXL87B5GTR5G0H2 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 6. Ajout de l'arôme chocolat : Retirez du feu (si vous étiez en train de chauffer). Incorporez l' essence d'arôme chocolat (si utilisée). Mélangez bien. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la marmite dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la marmite et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Turbinage (avec une machine à glace italienne) : Après maturation, versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 9. Durcissement : Transférez la glace turbinée dans des bacs hermétiques et placez-les au congélateur pendant au moins 2 à 4 heures pour qu'ils durcissent complètement. Conseils Spécifiques ● Qualité des ingrédients : L'utilisation de lait en poudre de bonne qualité et d'une poudre de cacao intense (type cacao hollandais) fera une grande différence pour le goût final de votre glace au chocolat. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires.

Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Chocolat intense (optionnel) : Si vous aimez un goût de chocolat encore plus intense, vous pouvez ajouter 20-30 g de chocolat noir de bonne qualité (minimum 70% de cacao), haché, dans la base chaude (étape 5, juste avant de retirer du feu) pour le faire fondre et l'incorporer avant de refroidir. ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue. SALEUXL87B5GTR5G0H2 Profitez de votre délicieuse glace au chocolat faite maison !

R145 3. Glace Parfumée à la Fraise (simple, arôme)

Reference formulation — not released for production. Source S020, PDF page 11 through PDF page 13.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Original source recipe evidence

Cette recette de glace parfumée à la fraise, vive et onctueuse, vous permettra de produire environ 2,5 litres de cette délicieuse douceur, avec une texture parfaite grâce à un équilibre optimal des ingrédients. Les jaunes d'œufs restent optionnels selon votre préférence. Ingrédients (pour environ 2,5 litres de glace) ● Eau : 1625 g (ml) ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Stabilisateur pour glace : 12,5 g (vous pouvez arrondir à 12 ou 13g) ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme fraise (liquide) : 15-20 ml (ajuster selon l'intensité désirée) ● Colorant en poudre (rouge) : 2 g (pour une couleur vive) ● Pincée de sel : 1 g (pour rehausser les saveurs) Préparation Étape par Étape 1. Mélange des poudres : Dans un grand bol, mélangez très soigneusement le sucre en poudre , le lait en poudre entier , le stabilisateur pour glace et la pincée de sel . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Chauffage de l'eau : Dans une grande casserole, versez l' eau . Faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. SALEUXL87B5GTR5G0H2 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Ajout des arômes et colorant : Une fois la base froide et mature, incorporez l' essence d'arôme fraise et le colorant rouge . Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. Conseils Spécifiques ● Qualité des ingrédients : L'utilisation de lait en poudre de bonne qualité et d'un arôme de fraise concentré fera une grande différence pour le goût final de votre glace. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Intensité de l'arôme : Commencez avec une petite quantité d'arôme de fraise et ajustez après le refroidissement de la base, car l'intensité peut varier selon les marques. ● Couleur : Le colorant permet d'obtenir une couleur rose attrayante, mais il est facultatif si vous préférez une couleur naturelle (qui sera alors très pâle). SALEUXL87B5GTR5G0H2 ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue.

R146 4. Glace Fraîche à la Menthe (arôme)

Reference formulation — not released for production. Source S020, PDF page 13 through PDF page 15.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. SALEUXL87B5GTR5G0H2 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Ajout des arômes et colorant : Une fois la base froide et mature, incorporez l' essence d'arôme menthe et le colorant vert . Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. Conseils Spécifiques ● Puissance de l'arôme : L'arôme de menthe est puissant. Commencez avec une petite quantité (par exemple, 10 ml) et augmentez si nécessaire après avoir goûté la base froide. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Ajout de pépites de chocolat (optionnel) : Pour une glace "menthe-chocolat", vous pouvez ajouter des pépites de chocolat noir haché en fin de turbinage. SALEUXL87B5GTR5G0H2 ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue.

R147 5. Glace Énergisante au Café (arôme)

Reference formulation — not released for production. Source S020, PDF page 15 through PDF page 17.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Cette recette de glace au café est parfaite pour les amateurs de café, offrant un coup de fouet rafraîchissant avec une texture douce et onctueuse. Elle vous permettra de produire environ 2,5 litres de cette délicieuse douceur, avec un équilibre parfait des saveurs. Les jaunes d'œufs restent optionnels selon votre préférence. Ingrédients (pour environ 2,5 litres de glace) ● Eau : 1500 g (ml) ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Café instantané en poudre (soluble) : 30-40 g (selon l'intensité désirée) ● Stabilisateur pour glace : 10 g ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme café (liquide) : 10 ml (facultatif, pour renforcer le goût) ● Pincée de sel : 1 g (pour rehausser les saveurs) Préparation Étape par Étape 1. Mélange des poudres : Dans un grand saladier, mélangez très soigneusement le sucre en poudre , le lait en poudre entier , le café instantané en poudre , le stabilisateur pour glace et la pincée de sel . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Chauffage de l'eau : Dans une grande casserole, versez l' eau . Faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. Le café instantané doit être complètement dissous. SALEUXL87B5GTR5G0H2 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Ajout de l'arôme : Une fois la base froide et mature, incorporez l' essence d'arôme café (si utilisée). Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. Conseils Spécifiques ● Intensité du café : Choisissez un café instantané de bonne qualité pour une saveur optimale. La quantité de café instantané (30-40g) peut être ajustée selon l'intensité de goût que vous désirez. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! SALEUXL87B5GTR5G0H2 ● Variante "café au lait" : Pour une glace "café au lait" encore plus prononcée, vous pouvez ajouter une petite quantité d'essence d'arôme lait si vous le souhaitez, ou même réduire légèrement la quantité de café instantané. ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue.

R148 6. Glace Douce à la Banane (arôme)

Original source recipe evidence

Une glace onctueuse avec le goût familier de la banane. Ingrédients (pour environ 1,2 litre de glace) ● Eau : 750 g(l) ● Lait en poudre entier (26% MG) : 120 g ● Sucre en poudre : 200 g ● Stabilisateur pour glace : 5 g ● Jaunes d'œufs : 3 (environ 50 g) ● Essence d'arôme banane (liquide) : 8-10 ml (environ 1,5 à 2 cuillères à café) - ajuster selon l'intensité désirée ● Colorant en poudre (jaune, facultatif) : 0,5 g (pointe de couteau) Préparation étape par étape : 1. Mélange des poudres : Dans un grand bol, mélangez le sucre en poudre , le lait en poudre entier et le stabilisateur . 2. Préparation des jaunes : Dans un autre bol, fouettez légèrement les jaunes d'œufs . 3. Chauffage de l'eau : Dans une casserole, faites chauffer l' eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Tempering (pour les œufs) : Versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. SALEUXL87B5GTR5G0H2 6. Pasteurisation : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. 7. Refroidissement rapide : Refroidissez la base le plus rapidement possible (bain-marie de glace). Remuez de temps en temps jusqu'à ce que la base soit froide (4°C ou moins). 8. Ajout des arômes et colorant : Une fois la base froide, incorporez l' essence d'arôme banane et le colorant jaune (si utilisé). Mélangez bien. 9. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . 10. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 11. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures. Conseils Spécifiques : ● L'arôme de banane est souvent assez prononcé, commencez par la quantité inférieure et ajustez au goût après refroidissement. ● Pour une texture encore plus riche, vous pouvez ajouter une banane mûre mixée très finement à la base froide avant le turbinage (cela peut affecter légèrement la durée de conservation).

Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. 8. Ajout des arômes et colorant : Une fois la base froide et mature, incorporez l' essence d'arôme caramel et le colorant brun clair (si utilisé). Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. SALEUXL87B5GTR5G0H2 Conseils Spécifiques ● Intensité de l'arôme : L'arôme de caramel est souvent assez prononcé, commencez par la quantité inférieure (15 ml) et ajustez au goût après refroidissement de la base. ● Caramel complexe (optionnel) : Pour un goût de caramel plus profond et complexe, vous pouvez faire un caramel à sec avec 40-50g de sucre (à prélever sur les 500g totaux) dans une petite casserole, puis le déglacer avec une petite partie de l'eau chaude (environ 50-100 ml) de la recette avant d'ajouter le reste des ingrédients secs. Laissez refroidir avant de l'incorporer à la base.

● Garniture (optionnel) : Un filet de sauce caramel peut être ajouté en fin de turbinage ou en nappage au moment de servir pour une touche gourmande. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue.

R151 9. Glace Subtile à la Pistache (arôme)

Original source recipe evidence

Une glace élégante avec un parfum délicat de pistache. Cette recette de glace à la pistache, élégante et au parfum délicat, vous permettra de produire environ 2,5 litres de cette délicieuse douceur, avec une texture parfaite grâce à un équilibre optimal des ingrédients. Les jaunes d'œufs restent optionnels selon votre préférence. Ingrédients (pour environ 2,5 litres de glace) ● Eau : 1800 g (ml) SALEUXL87B5GTR5G0H2 ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Stabilisateur pour glace : 12,5 g (vous pouvez arrondir à 12 ou 13g) ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme pistache (liquide) : 10-15 ml (à doser avec prudence et ajuster au goût) ● Colorant en poudre (vert pomme, facultatif) : 1 g (pour une couleur pistache) ● Pincée de sel : 1 g (pour rehausser les saveurs) Préparation Étape par Étape 1. Mélange des poudres : Dans un grand bol, mélangez très soigneusement le sucre en poudre , le lait en poudre entier , le stabilisateur pour glace et la pincée de sel . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Chauffage de l'eau : Dans une grande casserole, versez l' eau . Faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. SALEUXL87B5GTR5G0H2 8. Ajout des arômes et colorant : Une fois la base froide et mature, incorporez l' essence d'arôme pistache et le colorant vert pomme (si utilisé). Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. Conseils Spécifiques ● Intensité de l'arôme : L'arôme de pistache peut être délicat. Goûtez la base froide et ajustez la quantité selon l'intensité désirée. ● Texture et goût plus riches (optionnel) : Pour une texture et un goût plus riches, vous pouvez ajouter 20g de pâte de pistache pure (si disponible) directement à la base chaude (étape 6, juste avant de retirer du feu) pour la faire fondre et l'incorporer avant de refroidir. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctueuse supplémentaires. Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue.

R152 10. Glace Douce à l'Ananas (arôme)

Reference formulation — not released for production. Source S020, PDF page 24 through PDF page 28.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Cette recette de glace à l'ananas, à la saveur sucrée et légèrement acidulée en version crémeuse, vous permettra de produire environ 2,5 litres de cette délicieuse douceur, avec une texture parfaite grâce à un équilibre optimal des ingrédients. Les jaunes d'œufs restent optionnels selon votre préférence. SALEUXL87B5GTR5G0H2 Ingrédients (pour environ 2,5 litres de glace) ● Eau : 1800 g (ml) ● Lait en poudre entier (26% MG) : 250 g ● Sucre en poudre : 500 g ● Stabilisateur pour glace : 12,5 g (vous pouvez arrondir à 12 ou 13g) ● Jaunes d'œufs : 3 (environ 50 g) (Optionnel, pour une richesse accrue et une texture plus veloutée) ● Essence d'arôme ananas (liquide) : 15-20 ml (ajuster selon l'intensité désirée) ● Colorant en poudre (jaune, facultatif) : 1 g (pour une couleur ensoleillée) ● Pincée de sel : 1 g (pour rehausser les saveurs) Préparation Étape par Étape 1. Mélange des poudres : Dans un grand bol, mélangez très soigneusement le sucre en poudre , le lait en poudre entier , le stabilisateur pour glace et la pincée de sel . Assurez-vous que tout est bien combiné pour éviter les grumeaux. 2. Préparation des jaunes (si utilisés) : Si vous choisissez d'utiliser les jaunes d'œufs, séparez-les des blancs et battez-les légèrement dans un petit bol. Si vous ne les utilisez pas, passez directement à l'étape 3. 3. Chauffage de l'eau : Dans une grande casserole, versez l' eau . Faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres sèches dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Tempering (pour les œufs, si utilisés) : Si vous avez choisi d'utiliser les jaunes d'œufs, versez une petite quantité de cette base chaude sur les jaunes d'œufs fouettés en remuant constamment. Puis, reversez le tout dans la casserole. Si vous n'avez pas utilisé les jaunes, passez à l'étape 6. 6. Pasteurisation (si les jaunes d'œufs sont utilisés) : Remettez la casserole sur feu doux. Chauffez la base en remuant sans arrêt jusqu'à ce qu'elle atteigne 80-85°C . Maintenez cette température pendant 1 minute, puis retirez du feu. Cette étape pasteurise les œufs et améliore la texture. 7. Refroidissement rapide et maturation : Refroidissez la base le plus rapidement possible (par exemple, en plaçant la casserole dans un évier rempli d'eau froide et de glaçons, en remuant de temps en temps). Remuez jusqu'à ce que la base soit froide (4°C ou moins). Couvrez la base et placez-la au réfrigérateur pendant au moins 12 à 24 heures . Cette étape de maturation est essentielle pour que le stabilisateur (et les protéines du lait/œufs si utilisés) s'hydratent pleinement, garantissant une texture lisse et sans cristaux. SALEUXL87B5GTR5G0H2 8. Ajout des arômes et colorant : Une fois la base froide et mature, incorporez l' essence d'arôme ananas et le colorant jaune (si utilisé). Mélangez bien. 9. Turbinage (avec une machine à glace italienne) : Versez la base bien froide dans votre machine à glace italienne. Suivez les instructions spécifiques de votre machine pour le processus de turbinage. Le turbinage incorpore de l'air et affine la texture, rendant la glace onctueuse. 10. Durcissement : Transférez la glace turbinée dans un récipient hermétique et placez-la au congélateur pendant au moins 2 à 3 heures pour qu'elle durcisse complètement. Conseils Spécifiques ● Goût complexe (optionnel) : Pour un goût plus complexe, vous pouvez ajouter quelques gouttes d'essence de coco pour créer une saveur piña colada. ● Morceaux de fruits (optionnel) : Si vous souhaitez des morceaux de fruits, incorporez 50g d'ananas frais coupés en petits dés en fin de turbinage. ● Jaunes d'œufs (optionnel) : Si vous choisissez d'utiliser les jaunes, assurez-vous qu'ils sont à température ambiante avant de les tempérer. Leur ajout apporte une richesse et une onctuosité supplémentaires.

Si vous n'utilisez pas les jaunes, la glace sera un peu moins riche mais restera très onctueuse grâce au stabilisateur et au lait en poudre. ● Maturation : L'étape de refroidissement et de maturation au réfrigérateur est cruciale pour que le stabilisateur et les protéines du lait s'hydratent pleinement, garantissant une texture lisse et sans cristaux. Ne la sautez pas ! ● Hygiène : Si des œufs sont utilisés, assurez-vous d'une hygiène irréprochable lors de la manipulation et consommez la glace dans un délai raisonnable (environ 2-3 semaines au congélateur). Si vous ne mettez pas d'œufs, la conservation peut être légèrement plus longue. SALEUXL87B5GTR5G0H2 PARTIE 2 : SORBETS AUX FRUITS FRAIS ET EXOTIQUES Les recettes de cette section sont idéales pour ceux qui recherchent des glaces naturelles, légères et digestes , parfaites pour les journées chaudes. Ces sorbets mettent en valeur les fruits tropicaux locaux comme l’ananas, la mangue, le gingembre, la pastèque, ou encore le citron. Chaque fiche de recette inclura : ● Les quantités exactes de fruits, d’eau et de sucre, et lait ● L’ajout de jus de citron pour équilibrer le goût et préserver la couleur, ● L’utilisation (optionnelle mais recommandée) d’un stabilisateur pour améliorer la tenue du sorbet, ● Et des variantes locales selon la saison ou la région. Voici les recettes de sorbets aux fruits, ajustées pour inclure 250 grammes de lait en poudre. Cela les rendra plus crémeux et onctueux, se rapprochant d'une glace sans utiliser d'œufs. Je n'ai pas ajouté de jaunes d'œuf à ces recettes, car l'ajout de lait en poudre apporte déjà une richesse et une

texture améliorée suffisantes, tout en conservant la fraîcheur du sorbet. Principes de Base pour les Sorbets Enrichis au Lait en Poudre ● Lait en poudre : C'est l'ingrédient clé qui apporte de la matière sèche, des protéines et un peu de matière grasse (selon le type de lait en poudre utilisé) pour une onctuosité inégalée. ● Dissolution parfaite : Le secret pour éviter les grumeaux est de dissoudre le lait en poudre dans une partie tiède du liquide (eau ou purée de fruits légèrement chauffée) avant de l'incorporer au reste de la base froide. ● Maturation renforcée : Avec l'ajout de lait en poudre, la maturation au réfrigérateur (4 à 12 heures) devient encore plus cruciale. Elle permet au lait en SALEUXL87B5GTR5G0H2 poudre de bien s'hydrater et aux saveurs de se développer, résultant en un sorbet encore plus onctueux après turbinage. ● Goût et Sucrosité : Le lait en poudre peut apporter une légère douceur et une note lactée. Goûtez toujours votre mélange avant le turbinage pour ajuster le sucre si nécessaire.

R153 1. Sorbet Mangue Exotique Enrichi au Lait en Poudre

Reference formulation — not released for production. Source S020, PDF page 28 through PDF page 29.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Un classique doux et ensoleillé, enrichi pour une onctuosité divine. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Chair de mangue mûre (pure) : 500 g (environ 2-3 mangues moyennes) ● Eau : 250 g ● Sucre en poudre : 150 g (ajuster selon la douceur de la mangue) ● Lait en poudre : 250 g ● Jus de citron frais : 15 ml (1 cuillère à soupe) - pour relever le goût et éviter l'oxydation ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation de la mangue : Pelez les mangues, retirez le noyau et coupez la chair en morceaux. Mixez la chair avec le jus de citron pour obtenir une purée très lisse. Passez la purée au travers d'un tamis fin (passoire) si vous voulez éliminer toutes les fibres pour un sorbet ultra-lisse. 2. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage de l'eau : Dans une casserole, faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres dans l'eau : Hors du feu, versez progressivement le mélange de poudres (sucre, stabilisateur, lait en poudre) dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. Assurez-vous qu'il n'y a pas de grumeaux de lait en poudre. 5. Mélange et refroidissement : Incorporez la purée de mangue à cette base liquide. Mélangez bien. Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 6. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. La maturation est essentielle pour que le lait en poudre s'hydrate correctement et pour une texture optimale. SALEUXL87B5GTR5G0H2 7. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez selon les instructions du fabricant. 8. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures pour qu'il durcisse davantage avant de servir.

R154 2. Sorbet Ananas Rafraîchissant Enrichi au Lait en Poudre

Original source recipe evidence

Acidulé et très désaltérant, avec une onctuosité surprenante. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Chair d'ananas frais (pure) : 600 g (environ 1 ananas moyen) ● Eau : 150 g ● Sucre en poudre : 180 g (ajuster selon l'acidité de l'ananas) ● Lait en poudre : 250 g ● Jus de citron vert (facultatif) : 10 ml (environ 1 cuillère à café) - pour équilibrer ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation de l'ananas : Pelez l'ananas, retirez le cœur dur et coupez la chair en morceaux. Mixez la chair pour obtenir une purée très lisse. Passez la purée au tamis fin pour éliminer toutes les fibres. 2. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage de l'eau : Dans une petite casserole, faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres dans l'eau : Hors du feu, versez progressivement le mélange de poudres dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Mélange des ingrédients : Incorporez cette base liquide avec le lait en poudre à la purée d'ananas et au jus de citron vert (si utilisé). Mélangez bien jusqu'à obtenir un mélange homogène. 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 7. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. SALEUXL87B5GTR5G0H2 8. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 9. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures.

R155 3. Sorbet Bissap (Hibiscus) Enrichi au Lait en Poudre

Reference formulation — not released for production. Source S020, PDF page 30 through PDF page 31.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Un sorbet original, coloré, délicieusement acidulé et désormais plus onctueux. Ingrédients (pour environ 1,3 litre de sorbet) : ● Fleurs de bissap séchées : 50 g ● Eau : 700 g (pour l'infusion) + 100 g (supplémentaire) ● Sucre en poudre : 200 g (ajuster selon votre goût et l'acidité du bissap) ● Lait en poudre : 250 g ● Stabilisateur pour glace : 4 g ● Jus de citron vert : 15-20 ml (1 à 1,5 cuillère à soupe) - pour rehausser la saveur Préparation étape par étape : 1. Infusion du bissap : Faites bouillir 700 g d'eau. Hors du feu, ajoutez les fleurs de bissap séchées. Couvrez et laissez infuser pendant 15-20 minutes, ou jusqu'à ce que l'infusion soit d'une couleur rouge intense. 2. Filtration : Filtrez l'infusion de bissap à travers une passoire fine ou une étamine pour ne récupérer que le liquide. Pressez bien les fleurs pour extraire tout le jus. 3. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 4. Chauffage de l'eau supplémentaire : Faites chauffer les 100 g d'eau supplémentaires jusqu'à ce qu'elle soit tiède (environ 40-50°C). 5. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans l'eau tiède en fouettant énergiquement jusqu'à dissolution complète. 6. Mélange des ingrédients : Dans un grand bol, combinez l'infusion de bissap filtrée (tiède), cette base liquide avec le lait en poudre, et le jus de citron vert. Mélangez bien jusqu'à ce que le tout soit homogène. 7. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 8. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 9. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. SALEUXL87B5GTR5G0H2 10. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures.

Original source recipe evidence

Un mariage audacieux de saveurs, frais, légèrement piquant et désormais plus onctueux. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Jus d'orange frais : 500 g (environ 4-5 oranges) ● Eau : 200 g ● Sucre en poudre : 180 g (ajuster selon la douceur des oranges) ● Lait en poudre : 250 g ● Gingembre frais râpé : 20-30 g (environ un morceau de 3-4 cm) - ajuster selon l'intensité désirée ● Jus de citron frais : 10 ml (environ 1 cuillère à café) ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation du gingembre : Pelez et râpez finement le gingembre frais. 2. Création de l'infusion de gingembre : Dans une casserole, faites chauffer l'eau avec le gingembre râpé jusqu'à frémissement. Laissez infuser hors du feu pendant 10 minutes. Filtrez l'infusion pour retirer les morceaux de gingembre. Laissez tiédir l'infusion. 3. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 4. Incorporation des poudres : Versez progressivement le mélange de poudres dans l'infusion de gingembre tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Mélange de la base : Dans un grand bol, combinez le jus d'orange frais, le jus de citron et la base liquide avec le lait en poudre. Mélangez bien jusqu'à ce que le tout soit homogène. 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. SALEUXL87B5GTR5G0H2 7. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 8. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 9. Original source recipe evidence

Un sorbet surprenamment crémeux, facile à faire et ultra-onctueux. Ingrédients (pour environ 1,3 - 1,4 litre de sorbet) : ● Bananes mûres (chair pure) : 600 g (environ 4-5 bananes) ● Eau : 200 g ● Sucre en poudre : 150 g (ajuster selon la douceur des bananes) ● Lait en poudre : 250 g ● Jus de citron frais : 20 ml (environ 2 cuillères à soupe) - essentiel pour éviter l'oxydation ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation de la banane : Pelez les bananes. Mixez immédiatement la chair avec le jus de citron frais pour obtenir une purée très lisse. Le citron est crucial ici pour éviter que la banane ne noircisse. 2. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage de l'eau : Dans une petite casserole, faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Mélange des ingrédients : Dans un grand bol, combinez la purée de banane et citron, et la base liquide avec le lait en poudre. Mélangez bien jusqu'à ce que le tout soit homogène. 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. SALEUXL87B5GTR5G0H2 7. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 8. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 9. Original source recipe evidence

Un sorbet éclatant de saveur de fraise fraîche, avec une texture améliorée. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Fraises fraîches (purée) : 600 g (environ 2 tasses de fraises entières) ● Eau : 150 g ● Sucre en poudre : 180 g (ajuster selon la douceur des fraises) ● Lait en poudre : 250 g ● Jus de citron frais : 15 ml (1 cuillère à soupe) - pour rehausser la saveur ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation des fraises : Lavez, équeutez et coupez les fraises en morceaux. Mixez-les avec le jus de citron pour obtenir une purée très lisse. 2. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage d'une partie de la purée de fraise : Prélevez environ 200 ml de la purée de fraise et faites-la chauffer légèrement dans une petite casserole (environ 40-50°C, ne pas faire bouillir). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans la purée de fraise tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Mélange des ingrédients : Dans un grand bol, combinez le reste de la purée de fraise et la base liquide avec le lait en poudre. Mélangez bien jusqu'à ce que le tout soit homogène. SALEUXL87B5GTR5G0H2 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 7. Original source recipe evidence

Un sorbet plein de peps, avec le zeste et le jus d'orange, et une texture plus onctueuse. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Jus d'orange fraîchement pressé : 600 g (environ 5-6 oranges) ● Eau : 150 g ● Sucre en poudre : 180 g (ajuster selon la douceur des oranges) ● Lait en poudre : 250 g ● Zeste d'une orange non traitée : 5 g (environ 1 cuillère à café) ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation des oranges : Lavez bien l'orange, râpez finement le zeste, puis pressez le jus. 2. Infusion du zeste : Dans une casserole, faites chauffer l'eau avec le zeste d'orange jusqu'à ce qu'elle soit tiède (environ 40-50°C). Laissez infuser 5-10 minutes, puis retirez le zeste ou passez au tamis si vous ne voulez pas les petits morceaux. 3. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans l'eau infusée (ou l'eau simple si vous n'avez pas infusé) tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. SALEUXL87B5GTR5G0H2 5. Mélange de la base : Dans un grand bol, combinez le jus d'orange et la base liquide avec le lait en poudre. Mélangez bien jusqu'à ce que le tout soit homogène. 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 7. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 8. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 9. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures.

Original source recipe evidence

Un sorbet vibrant et acidulé, avec le goût unique du fruit de la passion et une onctuosité sublime. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Pulpe de fruit de la passion (avec les pépins) : 300 g (environ 10-15 fruits) ● Eau : 500 g ● Sucre en poudre : 200 g (ajuster selon l'acidité des fruits) ● Lait en poudre : 250 g ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation du fruit de la passion : Coupez les fruits de la passion en deux et prélevez la pulpe (avec les pépins). Si vous préférez un sorbet sans pépins, passez la pulpe au tamis pour les retirer. 2. Mélange des poudres sèches : Dans un grand bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage de l'eau : Dans une casserole, faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). SALEUXL87B5GTR5G0H2 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Incorporation de la pulpe : Ajoutez la pulpe de fruit de la passion à la base liquide avec le lait en poudre. Mélangez bien. 6. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 7. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 8. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 9. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures. J'espère que ces recettes enrichies vous raviront ! N'hésitez pas si vous avez d'autres questions.

R163 11. Sorbet Jus de Baobab Acidulé Enrichi au Lait en Poudre

Reference formulation — not released for production. Source S020, PDF page 38 through PDF page 39.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Un sorbet unique et désaltérant, avec le goût légèrement acidulé et les bienfaits du fruit du baobab, adouci et rendu onctueux par le lait en poudre. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Poudre de fruit de baobab (pain de singe) : 70 g ● Eau : 700 g (pour la dilution de la poudre et la base) ● Sucre en poudre : 200 g (ajuster selon l'acidité du baobab et votre goût) ● Lait en poudre : 250 g ● Jus de citron frais : 10 ml (environ 1 cuillère à café) - facultatif, si le baobab n'est pas assez acidulé ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation du jus de baobab : Dans un grand bol, mélangez la poudre de fruit de baobab avec 700 g d'eau. Laissez reposer pendant 15-20 minutes en remuant de temps en temps pour que la poudre se dissolve bien et que la pulpe libère toutes ses saveurs. SALEUXL87B5GTR5G0H2 2. Filtration : Passez le mélange au travers d'un tamis fin ou d'une étamine pour obtenir un jus de baobab lisse, sans résidus. Pressez bien la pulpe pour en extraire tout le liquide. 3. Mélange des poudres sèches : Dans un petit bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 4. Chauffage d'une partie du jus de baobab : Prélevez environ 200 ml du jus de baobab filtré et faites-le chauffer légèrement dans une casserole (environ 40-50°C, ne pas faire bouillir). 5. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans le jus de baobab tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 6. Mélange de la base : Dans un grand bol, combinez le reste du jus de baobab filtré et la base liquide avec le lait en poudre. Mélangez bien jusqu'à ce que le tout soit homogène. Si vous trouvez le jus pas assez acidulé, ajoutez le jus de citron frais. 7. Refroidissement rapide : Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 8. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 9. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 10. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures. Conseils Spécifiques : ● La saveur et l'acidité de la poudre de baobab peuvent varier. Goûtez toujours le jus avant d'ajouter le sucre et le citron pour ajuster les quantités. ● Assurez-vous que la poudre de baobab est bien dissoute et que le jus est parfaitement filtré pour éviter une texture granuleuse.

R164 12. Sorbet Papaye Douceur Enrichi au Lait en Poudre

Reference formulation — not released for production. Source S020, PDF page 39 through PDF page 44.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Un sorbet doux et tropical, capturant la saveur délicate de la papaye mûre, avec une texture onctueuse et fondante. Ingrédients (pour environ 1,2 - 1,3 litre de sorbet) : ● Chair de papaye mûre (pure) : 550 g (environ 1 papaye moyenne à grande) SALEUXL87B5GTR5G0H2 ● Eau : 150 g ● Sucre en poudre : 150 g (ajuster selon la douceur naturelle de la papaye) ● Lait en poudre : 250 g ● Jus de citron frais : 15 ml (1 cuillère à soupe) - pour rehausser le goût et éviter l'oxydation ● Stabilisateur pour glace : 4 g Préparation étape par étape : 1. Préparation de la papaye : Pelez la papaye, retirez les graines noires et coupez la chair en morceaux. Mixez la chair avec le jus de citron pour obtenir une purée très lisse. Passez la purée au travers d'un tamis fin (passoire) si vous souhaitez une texture absolument sans fibres. 2. Mélange des poudres sèches : Dans un petit bol, mélangez soigneusement le sucre en poudre, le stabilisateur et le lait en poudre . 3. Chauffage de l'eau : Dans une casserole, faites chauffer l'eau à feu moyen jusqu'à ce qu'elle soit tiède (environ 40-50°C). 4. Incorporation des poudres : Hors du feu, versez progressivement le mélange de poudres dans l'eau tiède en fouettant énergiquement et constamment jusqu'à dissolution complète. 5. Mélange et refroidissement : Incorporez la purée de papaye à la base liquide avec le lait en poudre. Mélangez bien. Refroidissez la base rapidement (bain-marie de glace) jusqu'à 4°C ou moins. 6. Maturation : Couvrez la base et placez-la au réfrigérateur pendant au moins 4 à 12 heures. 7. Turbinage : Après maturation, versez la base froide dans votre machine à glace et turbinez. 8. Durcissement : Transférez le sorbet turbiné dans un récipient hermétique et placez-le au congélateur pendant au moins 2 à 3 heures. Conseils Spécifiques : ● Choisissez une papaye très mûre pour un maximum de saveur et de douceur naturelle. Les papayes "Solo" ou "Red Lady" sont souvent très parfumées. ● La papaye étant un fruit doux, le jus de citron est important pour équilibrer le goût et éviter qu'il ne soit trop fade. ● Assurez-vous de bien mixer la papaye pour une purée parfaitement lisse. SALEUXL87B5GTR5G0H2

R165 Recette 1 : Bâtonnets de Glace au Lait Goût Chocolat Optimisé

Reference formulation — not released for production. Source S031, PDF page 12 through PDF page 13.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

(10 Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) SALEXASYR3LL72ZB63T ● 200g de cacao en poudre non sucré de bonne qualité (pour une saveur chocolat intense) ● 35 ml d’arôme Chocolat(Pour la saveur chocolat pure et plus accentuée) ● 20 ml d'extrait de vanille (facultatif, pour approfondir la saveur chocolat) ● Colorant Marron pour accentuer la l’intensité de la couleur(facultatif) Préparation Spécifique 1. Ajoutez le cacao en poudre au mélange sec d'ingrédients de base (étape 1 de la préparation de base). 2. Incorporez l'arôme chocolat et l'extrait de vanille (si utilisé) après l'étape d'incorporation du stabilisateur (avant le mixage final). 3. Ajoutez un peu de colorant marron si souhaité pour rehausser visuellement la couleur de la glace. Mélangez très bien l'ensemble avec le mixeur plongeant. 4. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Si vous préférez plus sucré, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Qualité du Cacao : Un cacao de bonne qualité (pur et non sucré) garantira une saveur chocolatée intense sans arrière-goût. ● Dissolution : Assurez-vous que le cacao est parfaitement dissous pour éviter les grumeaux dans la glace finale. Le mixeur plongeant est très utile à cette étape.

R166 Recette 2 : Bâtonnets de Glace au Lait au Gingembre Frais (10

Reference formulation — not released for production. Source S031, PDF page 13 through PDF page 14.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) SALEXASYR3LL72ZB63T ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Gingembre frais : 300 à 350 g (selon intensité souhaitée) ● Jus de citron frais : 2 cuillères à soupe (pour équilibrer le goût) ● Arôme naturel de gingembre ou vanille (facultatif) : 5 à 10 ml ● Colorant jaune clair (facultatif) Préparation Spécifique : 1. Préparer le gingembre : Épluchez le gingembre frais et râpez-le très finement. Placez le gingembre râpé dans un mixeur avec 200 à 300 ml d’eau tiède. Mixez pour obtenir un jus très concentré. Filtrez impérativement ce jus à travers une passoire fine ou un tissu propre (étamine) pour retirer toutes les fibres de gingembre. Réservez le jus filtré. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Ajouter le gingembre et les arômes : Versez le jus de gingembre filtré, le jus de citron, et l’arôme si utilisé dans la grande marmite. 4. Ajoutez un peu de colorant jaune si souhaité pour rehausser visuellement la couleur de la glace. Mélangez très bien l'ensemble avec le mixeur plongeant. 5. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Le gingembre a une saveur piquante ; ajoutez le sucre si nécessaire pour équilibrer l'intensité. 6. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils du Glacier : ● Intensité du Gingembre : Pour une version plus douce, réduisez la quantité de gingembre à 250 g. Pour une version plus punchy et relevée, vous pouvez ajouter une toute petite quantité de poivre blanc ou de muscade râpée (environ 1 à 2 g) à l'étape d'ajout des arômes. ● Filtration Essentielle : Une filtration minutieuse du jus de gingembre est cruciale pour éviter toute fibre désagréable en bouche. ● Public cible : Cette glace plaît particulièrement aux adultes et peut être commercialisée comme une glace tonifiante ou rafraîchissante pour les journées chaudes. SALEXASYR3LL72ZB63T

R167 Recette 3 : Bâtonnets de Glace au Lait au Bissap Intense (10

Reference formulation — not released for production. Source S031, PDF page 15 through PDF page 16.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres, eau réduite) ● 8 litres d'eau filtrée ou bouillie et refroidie (le reste étant apporté par l'infusion de bissap) ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Fleurs séchées de bissap (hibiscus rouge) : 300 à 400 g ● Eau chaude pour l’infusion : 1,5 L ● Jus de citron : 2 cuillères à soupe ● Arôme de fraise ou vanille (facultatif) : 10 ml ● Colorant rouge naturel (facultatif) : quelques gouttes pour renforcer la teinte Préparation Spécifique : 1. Préparer l’infusion de bissap concentrée : Dans une casserole, faites bouillir 1,5 L d’eau. Retirez du feu, ajoutez 300 à 400 g de fleurs de bissap séchées. Laissez infuser pendant au moins 30 minutes à couvert pour obtenir une infusion bien concentrée. Filtrez l'infusion à travers un tamis fin ou un tissu propre pour retirer toutes les fleurs. Laissez refroidir complètement. 2. Ajuster l'eau de base : Dans la "Préparation de la Base Commune", utilisez 8 L d'eau au lieu de 9,5 L pour la base liquide, car l'infusion de bissap complétera le volume. 3. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 4. Ajouter l’infusion de bissap et les arômes : Versez l’infusion de bissap refroidie dans la base lactée. Ajoutez le jus de citron, l’arôme (si utilisé), et un peu de colorant rouge si souhaité pour intensifier la teinte. 5. Mixez le tout à haute vitesse pendant 2 à 3 minutes pour une homogénéité parfaite. SALEXASYR3LL72ZB63T 6. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Le bissap est naturellement acidulé ; ajustez le sucre si nécessaire pour trouver l'équilibre parfait. 7. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils du Glacier : ● Rôle du Citron : Le jus de citron est crucial pour équilibrer l’acidité naturelle du bissap et renforcer sa fraîcheur, donnant une glace vibrante. ● Version Premium : Pour une touche plus sophistiquée, vous pouvez ajouter une petite quantité de gingembre frais râpé (filtré) ou quelques gouttes de vanille naturelle à l'étape 4. ● Optimisation : Vous pouvez conserver les fleurs de bissap usées après infusion pour en faire un sirop léger ou un thé glacé économique en les infusant avec moins d'eau.

R168 Recette 4 : Bâtonnets de Glace au Lait à la Vanille Intense (10

Reference formulation — not released for production. Source S031, PDF page 16 through PDF page 17.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Extrait de vanille de bonne qualité : 40-50 ml (ou 2-3 gousses de vanille fendues et grattées pour une saveur naturelle) ● Poudre de vanille (facultatif) : 5-10 g (pour un effet moucheté et un parfum plus profond) Préparation Spécifique : SALEXASYR3LL72ZB63T 1. Si vous utilisez de la poudre de vanille, ajoutez-la au mélange sec d'ingrédients de base (étape 1 de la préparation de base). 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Incorporez l'extrait de vanille : Incorporez l'extrait de vanille (et les graines des gousses si vous en utilisez) à la préparation. Mélangez très bien pour que l'arôme se diffuse. 4. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Si vous préférez plus sucré, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Qualité de la Vanille : L'utilisation d'extraits de vanille pure ou de vraies gousses de vanille offrira une saveur bien supérieure et plus naturelle que les arômes artificiels. ● Poudre de Vanille : Si vous souhaitez les petits points noirs caractéristiques de la vanille dans votre glace, vous pouvez soit gratter les graines des gousses de vanille, soit ajouter de la poudre de vanille naturelle. ● Température : Assurez-vous que le mélange est très froid avant de le mettre au congélateur. Cela aide à obtenir une texture finale plus fine et plus onctueuse, minimisant la formation de cristaux.

R169 Recette 5 : Bâtonnets de Glace au Lait au Chocolat Blanc (10

Reference formulation — not released for production. Source S031, PDF page 17 through PDF page 18.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) SALEXASYR3LL72ZB63T ● Chocolat blanc de bonne qualité : 500 g (en pistoles ou haché finement) ● Extrait de vanille (facultatif) : 10 ml (pour rehausser la douceur) ● Jus de citron (facultatif) : 1 cuillère à café (pour couper la sucrosité si trop prononcée) Préparation Spécifique : 1. Faire fondre le chocolat blanc : Faites fondre le chocolat blanc au bain-marie ou très doucement au micro-ondes (par intervalles de 30 secondes, en remuant bien entre chaque intervalle) jusqu'à obtenir une texture lisse et homogène. Laissez-le tiédir légèrement pour qu'il ne soit pas trop chaud en l'incorporant. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Incorporez le chocolat blanc fondu et les arômes : Incorporez le chocolat blanc fondu et légèrement tiédi à la préparation. Ajoutez l'extrait de vanille et le jus de citron (si utilisés). Mélangez très bien l'ensemble avec le mixeur plongeant pour assurer une parfaite intégration et l'absence de grains de chocolat. 4. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Le chocolat blanc est naturellement très sucré, mais si vous préférez une glace encore plus sucrée, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Qualité du Chocolat : Un chocolat blanc de bonne qualité (avec un pourcentage de beurre de cacao d'au moins 20-25%) fera toute la différence pour le goût et la texture de la glace. Un chocolat de moindre qualité peut être difficile à travailler et donner un goût moins prononcé. ● Température d'Incorporation : Assurez-vous que le chocolat fondu n'est pas trop chaud lorsque vous l'ajoutez à la base pour éviter de "cuire" les ingrédients en poudre ou de déstabiliser le mélange. ● Mixage Intense : Le chocolat blanc peut avoir tendance à figer ou à rester en petits morceaux s'il n'est pas parfaitement intégré. Un mixeur plongeant est donc essentiel pour obtenir une texture parfaitement lisse et homogène.

R170 Recette 6 : Bâtonnets de Glace au Lait au Café Corsé (10 Litres)

Reference formulation — not released for production. Source S031, PDF page 18 through PDF page 20.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Ingrédients de Base Optimisés (pour 10 Litres, eau réduite) SALEXASYR3LL72ZB63T ● Eau filtrée ou bouillie et refroidie : 9,3 litres (si café instantané dilué) ou 9,05 litres (si espresso) ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Café instantané fort : 50-70 g (ou 200-250 ml d'espresso très fort refroidi) ● Eau chaude : 200 ml (pour dissoudre le café instantané) ● Extrait de vanille (facultatif) : 5-10 ml (pour adoucir et compléter la saveur du café) ● Cacao en poudre non sucré (facultatif) : 10-20 g (pour un "Moka" ou une couleur plus intense) Préparation Spécifique : 1. Préparer le café : Si vous utilisez du café instantané : Dissolvez les 50-70 g de café instantané dans 200 ml d'eau chaude. Remuez bien jusqu'à dissolution complète. Si vous utilisez de l'espresso : Préparez 200-250 ml d'espresso très fort. Dans les deux cas, laissez le café refroidir complètement avant de l'incorporer. 2. Ajuster l'eau de base : Utilisez la quantité d'eau ajustée dans la préparation de base (étape 1 de la "Préparation de la Base Commune") : 9,3 litres si vous utilisez du café instantané dilué, ou 9,05 litres si vous utilisez de l'espresso. Si vous utilisez du cacao, ajoutez-le au mélange sec. 3. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 4. Incorporez le café et les arômes : Incorporez le café refroidi et l'extrait de vanille (si utilisé) à la préparation. Mélangez très bien l'ensemble avec le mixeur plongeant. 5. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Le café apporte une certaine amertume ; vous pourriez vouloir ajuster le sucre. Ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète, jusqu'à obtenir le goût désiré. SALEXASYR3LL72ZB63T 6. Terminez par les étapes de refroidissement et versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Intensité du Café : Ajustez la quantité de café instantané ou la force de l'espresso selon l'intensité de saveur désirée. Un café plus corsé donnera une glace avec un goût plus prononcé. ● Cacao pour un "Moka" : Ajouter une petite quantité de cacao en poudre non sucré (10-20g) au mélange sec peut transformer cette recette en une délicieuse glace au lait saveur "Moka", très appréciée. ● Sucre : Le café peut nécessiter un peu plus de sucre pour équilibrer son amertume naturelle, surtout si vous utilisez un café très fort. Goûtez toujours et ajustez à votre convenance.

R171 Recette 7 : Bâtonnets de Glace au Jus de Noix de Coco

Reference formulation — not released for production. Source S031, PDF page 20 through PDF page 22.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Fraîche (10 Litres) Ingrédients de Base Optimisés (pour 10 Litres, eau réduite) ● Eau filtrée ou bouillie et refroidie : 8,5 litres ● Lait en poudre entier (26 % MG) : 500 g ● Lait concentré sucré : 500 g ● Sucre en poudre : 2,5 kg ● Beurre non salé (ou margarine) : 200 g ● Stabilisateur (gomme xanthane, guar ou CMC) : 10 à 15 g ● Pincée de sel : 5 g ● Eau filtrée ou bouillie et refroidie : 8,5 litres ● 500g de lait en poudre entier ● Jus de noix de coco maison (obtenu par pressage de noix de coco râpée) : 1 litre (Écrasez finement 2 à 3 noix de coco fraîches avec un peu d’eau tiède, puis filtrez le lait obtenu. Laissez reposer, puis utilisez le jus sans dépôt pour plus de légèreté.) ● Noix de coco râpée (facultatif) : 100 à 200 g (pour une touche de texture) ● Extrait de vanille (facultatif) : 10 ml ● Arôme naturel de noix de coco (facultatif, pour intensifier le goût) : 5 à 10 ml SALEXASYR3LL72ZB63T Préparation Étape par Étape : 1. Préparez les ingrédients secs : Dans un grand saladier, mélangez le lait en poudre, le sucre, la pincée de sel et, si désiré, la noix de coco râpée. 2. Préparez la base liquide : Versez 8,5 litres d’eau dans une grande marmite. Ajoutez progressivement le mélange sec tout en fouettant pour éviter les grumeaux. 3. Ajoutez le lait concentré sucré et le beurre ramolli . Remuez jusqu’à ce que tout soit bien incorporé. 4. Ajoutez le jus de noix de coco maison : Incorporez délicatement le jus filtré à la base. Mélangez longuement pour une intégration complète. 5. Incorporez le stabilisateur (gomme xanthane ou autre) : ○ Mélangez-le avec une petite quantité de sucre prélevée sur le total (2 c. à soupe). ○ Dissolvez ce mélange dans 500 ml de la préparation tiède. ○ Mixez ce petit volume vigoureusement au blender ou mixeur plongeant jusqu'à homogénéité. ○ Versez dans la marmite et mixez toute la préparation pendant 2 à 3 minutes. 6. Ajoutez les arômes (facultatif) : Versez l’extrait de vanille et/ou l’arôme de coco. Mélangez à nouveau. 7. Ajustez la douceur : Goûtez une petite portion refroidie. Si besoin, ajoutez jusqu’à 500 g de sucre supplémentaire, en remuant bien pour dissoudre. 8. Refroidissement et repos : Couvrez et placez au réfrigérateur pendant 3 à 4 heures, ou toute une nuit. 9. Versez dans les moules : Remplissez les moules à glace jusqu’à 90 %. Ajoutez des morceaux de fruits tropicaux si désiré. 10. Congélation : Placez au congélateur pendant au moins 6 à 8 heures. Conseils Spécifiques : ● Préparation du jus de noix de coco : Choisissez des noix fraîches. Râpez la chair, ajoutez de l’eau tiède, mixez puis pressez dans un linge propre. Utilisez le jus clair, sans dépôt. SALEXASYR3LL72ZB63T ● Texture : Si vous utilisez de la noix râpée, vous pouvez la filtrer après infusion pour une texture lisse, ou la conserver pour un effet granuleux artisanal. ● Conservation : Étiquetez vos glaces coco et stockez-les dans un sac ou bac bien fermé pour éviter les odeurs du congélateur. ● Idée bonus : Ajoutez des mini-dés d’ananas ou un filet de sirop de gingembre dans les moules avant congélation pour une touche "pays tropical". II. Les Saveurs Exotiques et Fruitées au Lait Cette catégorie rassemble les recettes mettant en vedette la fraîcheur et les arômes vibrants des fruits, pour des bâtonnets désaltérants et savoureux.

R172 Recette 8 : Bâtonnets de Glace au Lait Goût Fraise Optimisé (10

Reference formulation — not released for production. Source S031, PDF page 22 through PDF page 23.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● 20 ml d'extrait ou arôme de fraise liquide (ajuster selon l'intensité désirée) ● Quelques gouttes de colorant alimentaire rouge (facultatif, pour une couleur plus vive) ● 1 à 2 cuillères à café de jus de citron (pour équilibrer la douceur et rehausser l'arôme de fraise) Préparation Spécifique SALEXASYR3LL72ZB63T 1. Ajoutez l'extrait ou arôme de fraise, le jus de citron et le colorant alimentaire (si utilisé) après l'étape d'incorporation du stabilisateur (avant le mixage final). 2. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir et goûtez. Si vous préférez plus sucré, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 3. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Arôme et Citron : Le jus de citron est essentiel pour "réveiller" l'arôme de fraise et éviter que la glace ne soit trop plate. Ajustez la quantité d'arôme selon l'intensité désirée. ● Coloration : Le colorant alimentaire est facultatif mais peut rendre la glace plus attrayante visuellement, surtout pour la vente.

R173 Recette 9 : Bâtonnets de Glace au Lait Goût Banane (10 Litres)

Reference formulation — not released for production. Source S031, PDF page 23 through PDF page 24.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Bananes bien mûres : 1,2 kg (épluchées) ● Jus de citron : 2 à 3 cuillères à soupe (≈ 30-45 ml) ● Extrait de vanille : 10 ml (facultatif) ● Colorant jaune (facultatif) SALEXASYR3LL72ZB63T Étapes de Préparation : 1. Préparer les bananes : Épluchez les bananes mûres, coupez-les en rondelles et mixez-les avec le jus de citron. Vous devez obtenir une purée bien lisse et homogène. Réservez cette purée. 2. Suivez les étapes 1 à 3 de la "Préparation de la Base Commune". 3. Incorporer la purée de banane : Ajoutez la purée de banane réservée dans la grande marmite avec la base liquide. Mélangez doucement mais soigneusement. 4. Procédez à l'étape 4 (incorporation du stabilisateur) et 5 (mixage final) de la "Préparation de la Base Commune", en vous assurant que la purée de banane est parfaitement intégrée et que le mélange est lisse. 5. Ajoutez l’arôme et le colorant : Versez l’extrait de vanille et, si souhaité, quelques gouttes de colorant jaune. Mélangez bien. 6. Ajustement de la douceur : Prélevez une petite quantité de préparation, laissez-la refroidir un peu et goûtez. Ajustez le sucre si besoin, les bananes mûres étant déjà naturellement sucrées. 7. Terminez par les étapes 6 (refroidissement), 7 (versement dans les moules) et 8 (congélation) de la "Préparation de la Base Commune". Conseil Spécifique : ● Choix des Bananes : Des bananes très mûres (avec des taches brunes) sont idéales car elles sont plus sucrées et plus faciles à réduire en purée lisse. ● Prévention de l'Oxydation : Le jus de citron est crucial pour éviter que la purée de banane ne noircisse avant la congélation. ● Texture : Le stabilisateur est essentiel ici pour éviter une texture fibreuse ou granuleuse après congélation, due aux fibres de la banane. Un mixage très fin est recommandé.

R174 Recette 10 : Bâtonnets de Glace au Lait à l'Orange Fraîche (10

Reference formulation — not released for production. Source S031, PDF page 24 through PDF page 25.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) SALEXASYR3LL72ZB63T ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Jus d’orange frais filtré (ou pressé maison) : 500 ml ● Zeste râpé d’orange douce (optionnel mais conseillé) : 1 cuillère à soupe ● Arôme naturel ou extrait d’orange : 20 ml ● Jus de citron : 1 à 2 cuillères à café (pour équilibrer l'acidité et renforcer la fraîcheur) ● Colorant orange (facultatif) : quelques gouttes pour une couleur plus attrayante Préparation Spécifique : 1. Ajoutez le zeste d'orange râpé (si utilisé) au mélange sec d'ingrédients de base (étape 1 de la préparation de base). 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Ajouter les saveurs fruitées : Versez le jus d’orange filtré, l’extrait/arôme d’orange, le jus de citron et le colorant si utilisé. Mélangez soigneusement avec un fouet ou le mixeur plongeant pour bien incorporer. 4. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Si vous préférez plus sucré ou si le goût est trop acide, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Choix de l’orange : Utilisez de l’orange douce bien mûre pour un goût riche et agréable. Si vos oranges sont trop acides, n'hésitez pas à augmenter légèrement la quantité de sucre pour équilibrer. ● Zeste : Le zeste rehausse naturellement l’arôme de l'orange. Râpez uniquement la couche colorée extérieure (orange) et évitez la partie blanche (l'albédo) qui peut être amère. ● Texture : Le stabilisateur est essentiel ici pour contrer l'acidité naturelle des agrumes et obtenir une glace douce et non cristalline. ● Couleur : Un soupçon de colorant peut séduire davantage les enfants et rendre vos bâtonnets plus visuellement attractifs pour la vente. SALEXASYR3LL72ZB63T

R175 Recette 11 : Bâtonnets de Glace au Lait à la Papaye Mûre (10

Reference formulation — not released for production. Source S031, PDF page 26 through PDF page 27.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Papaye bien mûre (chair uniquement, sans graines) : 1,2 kg ● Jus de citron : 1 cuillère à soupe (pour conserver la couleur et rehausser le goût) ● Arôme naturel de vanille ou de papaye (facultatif) : 10 à 20 ml ● Colorant orangé (facultatif, selon l’intensité naturelle du fruit) Préparation Spécifique : 1. Préparer la purée de papaye : Épluchez et épépinez les papayes. Mixez la chair dans un blender très puissant jusqu’à obtenir une purée bien lisse et sans morceaux. Si nécessaire, passez cette purée au tamis fin pour retirer les fibres résiduelles. Réservez. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Ajoutez la purée de papaye et les arômes : Versez la purée de papaye préparée, le jus de citron, l’arôme (si utilisé), et un peu de colorant si nécessaire dans la grande marmite. Mélangez très bien à l'aide du mixeur plongeant pour que la purée soit parfaitement intégrée et que la texture soit homogène et sans fibres. 4. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Ajustez le sucre si besoin. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : SALEXASYR3LL72ZB63T ● Choix de la Papaye : Choisissez une papaye bien mûre (chair orange foncée, parfumée) pour maximiser la douceur naturelle et la couleur. ● Importance du Mixage : Le mixage final est indispensable pour éviter que des fibres de papaye ne donnent une texture rugueuse à vos bâtonnets. Une purée très lisse est la clé. ● Équilibre : Une petite quantité de jus de citron est importante pour équilibrer la douceur de la papaye et conserver sa couleur vive. N'en mettez pas trop pour ne pas masquer le goût délicat du fruit.

R176 Recette 12 : Bâtonnets de Glace au Lait à l’Ananas Frais (10

Reference formulation — not released for production. Source S031, PDF page 27 through PDF page 28.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Ananas bien mûr, pelé et coupé : 1,2 à 1,3 kg (poids net de chair sans cœur dur) ● Jus de citron : 1 cuillère à soupe (facultatif, pour accentuer le goût et conserver la couleur) ● Arôme naturel d’ananas (facultatif, si le fruit manque de parfum) : 10 à 15 ml ● Colorant jaune clair (facultatif, pour une teinte plus attractive) Préparation Spécifique : 1. Préparer la purée d’ananas : Retirez soigneusement la peau, les yeux et le cœur fibreux de l’ananas. Coupez la chair en morceaux et mixez-la dans un blender très puissant jusqu’à obtenir une purée fluide et lisse. Filtrez cette purée au besoin pour retirer les fibres épaisses ou les petits morceaux. Réservez. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Ajouter la purée d’ananas et les arômes : Versez la purée d'ananas, le jus de citron et l’arôme (si utilisé). Ajoutez un peu de colorant si nécessaire pour SALEXASYR3LL72ZB63T intensifier la couleur jaune. Mélangez très bien l'ensemble avec le mixeur plongeant pour une homogénéisation parfaite. 4. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). L'ananas peut être plus ou moins acide ; si vous le trouvez trop acide, vous pouvez ajouter 100 à 200 g de sucre supplémentaire (prélevé sur le total de 500g additionnels si non utilisé auparavant) pour équilibrer le goût. Remuez jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Choix de l'Ananas : Choisissez un ananas bien mûr, avec une chair bien jaune à l’intérieur et un parfum prononcé. C’est le signe d’une bonne maturité et d’une richesse en goût. ● Élimination du Cœur : Ne conservez absolument pas le cœur de l'ananas, car il est très fibreux et peut donner une texture désagréable à la glace, même après mixage. ● Rôle du Citron : Le jus de citron est facultatif, mais il peut faire ressortir la vivacité et la fraîcheur du fruit, surtout si l'ananas est très sucré. ● Mixage Prolongé : Un mixage prolongé avec le mixeur plongeant est recommandé pour garantir une texture fine et agréable en bouche, sans résidus fibreux.

R177 Recette 13 : Bâtonnets de Glace au Lait à la Mangue Fraîche (10

Reference formulation — not released for production. Source S031, PDF page 28 through PDF page 29.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Mangues bien mûres (variété douce, sans fibres) : 1,2 à 1,5 kg (chair sans noyau) SALEXASYR3LL72ZB63T ● Jus de citron : 1 cuillère à soupe (pour équilibrer la douceur) ● Arôme naturel de mangue (facultatif, pour renforcer la saveur) : 10 à 15 ml ● Colorant jaune-orangé (facultatif) Préparation Spécifique : 1. Préparer la purée de mangue : Épluchez les mangues, retirez les noyaux et récupérez uniquement la chair. Mixez longuement jusqu’à obtenir une purée lisse et fluide. Si nécessaire, passez au tamis fin pour éliminer toute fibre résiduelle et obtenir une texture parfaitement veloutée. Réservez. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Ajouter la purée de mangue et les arômes : Ajoutez la purée de mangue préparée, le jus de citron, l’arôme (si utilisé) et éventuellement une pointe de colorant jaune-orangé naturel pour intensifier la couleur. Mélangez très bien l'ensemble avec le mixeur plongeant pour une intégration parfaite. 4. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Si la mangue est peu sucrée ou si vous préférez une glace plus douce, ajoutez 100 à 200 g de sucre supplémentaire (prélevé sur le total de 500g additionnels si non utilisé auparavant) selon votre goût. Remuez jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Choix des Mangues : Utilisez des mangues très mûres (presque molles au toucher) pour un goût intense et une texture naturellement crémeuse. ● Variété Sans Filaments : La variété de mangue sans filaments (comme la mangue Kent ou Amélie) est idéale pour cette recette, car elle assure une purée lisse et agréable en bouche. Évitez les mangues fibreuses qui peuvent donner un rendu granuleux même après un bon mixage. ● Rôle du Citron : Un peu de jus de citron permet d'équilibrer la sucrosité naturelle de la mangue et de prolonger légèrement la conservation de la glace.

R178 Recette 14 : Bâtonnets de Glace au Lait au Baobab (10 Litres)

Reference formulation — not released for production. Source S031, PDF page 29 through PDF page 31.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Ingrédients de Base Optimisés (pour 10 Litres, eau réduite) ● 9 litres d'eau filtrée ou bouillie et refroidie (le reste étant apporté par l'eau pour la dilution du baobab) ● 500g de lait en poudre entier SALEXASYR3LL72ZB63T ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Poudre de baobab pur (100% naturelle) : 400 à 500 g ● Eau tiède pour dilution : 500 ml ● Jus de citron jaune (ou vert) : 1 cuillère à soupe ● Arôme naturel de banane ou vanille (facultatif) : 5 à 10 ml ● Colorant blanc cassé ou beige doux (facultatif) Préparation Spécifique : 1. Préparer la pâte de baobab : Dans un saladier, mélanger les 400 à 500 g de poudre de baobab avec 500 ml d’eau tiède. Fouettez ou mixez vigoureusement jusqu’à obtenir une pâte parfaitement lisse, sans aucun grumeau. Il est important que cette pâte soit homogène. Réservez au frais. 2. Ajuster l'eau de base : Dans la "Préparation de la Base Commune", utilisez 9 L d'eau au lieu de 9,5 L pour la base liquide, car la pâte de baobab apportera le volume complémentaire. 3. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 4. Ajouter la pâte de baobab et les arômes : Incorporez la préparation de baobab réservée, le jus de citron, et l’arôme (facultatif) à la base lactée. 5. Mixez l'ensemble pendant 2 à 3 minutes à haute vitesse avec le mixeur plongeant pour assurer une parfaite intégration et une texture très lisse. 6. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit si possible). Le baobab est naturellement acide, donc l'équilibre du sucre est crucial. Ajustez si nécessaire. 7. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils du Glacier : ● Équilibre Acide-Sucré : Le baobab est naturellement acide. Le lait concentré et le sucre jouent un rôle clé pour équilibrer cette acidité et rendre la glace harmonieuse en bouche. SALEXASYR3LL72ZB63T ● Texture et Satiété : La poudre de baobab donne une glace avec une texture naturellement plus dense et veloutée. Elle est aussi plus rassasiante que d'autres glaces, ce qui peut être un argument de vente. ● Variantes : Vous pouvez créer des variantes en associant le baobab avec du gingembre (filtré) pour une touche piquante, ou avec du miel et un peu plus de citron pour une saveur plus douce et fruitée.

R179 Recette 15 : Bâtonnets de Glace au Lait à la Goyave Fraîche (10

Reference formulation — not released for production. Source S031, PDF page 31 through PDF page 32.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Goyaves bien mûres : 1,2 kg (chair uniquement, sans graines) ● Jus de citron frais : 1 à 2 cuillères à soupe (pour équilibrer la douceur et rehausser la saveur) ● Arôme naturel de goyave ou de fraise (facultatif) : 10 à 15 ml ● Colorant rose pâle ou rouge clair (facultatif) : quelques gouttes pour une couleur plus vive Préparation Spécifique : 1. Préparer la purée de goyave : Lavez les goyaves. Coupez-les en deux et retirez soigneusement toutes les graines à l'aide d'une petite cuillère. Ne gardez que la chair. Mixez la chair dans un blender jusqu'à obtenir une purée très lisse et homogène. Si désiré, passez la purée à travers un tamis fin pour assurer l'absence totale de petits grains ou résidus. Réservez cette purée. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Incorporez la purée de goyave et les arômes : Versez la purée de goyave filtrée (si vous l'avez filtrée), le jus de citron et l'arôme (si utilisé) dans la grande marmite. Ajoutez quelques gouttes de colorant si vous souhaitez intensifier la SALEXASYR3LL72ZB63T couleur rose pâle ou rouge clair de la glace. Mélangez très bien l'ensemble avec le mixeur plongeant pour une intégration parfaite. 4. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Si vous préférez plus sucré, ajoutez le sucre restant (jusqu'à 500g supplémentaires), cuillère par cuillère, en remuant jusqu'à dissolution complète. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Choix des Goyaves : Préférez des goyaves bien mûres (légèrement molles au toucher) et très parfumées. Les variétés à chair rose sont idéales pour une couleur naturelle et un goût intense. ● Retrait des Graines : C'est une étape cruciale pour une texture lisse et agréable en bouche. Les graines de goyave sont dures et désagréables dans la glace. Le tamisage est une garantie supplémentaire. ● Équilibre des Saveurs : La goyave a une douceur naturelle, mais le jus de citron est important pour éviter que la glace ne soit trop "lourde" et pour "réveiller" et rehausser l'arôme du fruit.

R180 Recette 16 : Bâtonnets de Glace au Lait au Fruit de la Passion

Reference formulation — not released for production. Source S031, PDF page 32 through PDF page 34.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

(10 Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) ● Pulpe de fruit de la passion (avec graines) : 800 g à 1 kg (environ 30-40 fruits) ● Jus de citron frais : 1 cuillère à soupe (pour intensifier l'acidité et la fraîcheur) ● Arôme naturel de fruit de la passion (facultatif) : 10 ml SALEXASYR3LL72ZB63T ● Colorant jaune-orangé (facultatif) : quelques gouttes pour une couleur plus éclatante Préparation Spécifique : 1. Préparer la pulpe de fruit de la passion : Coupez les fruits de la passion en deux et prélevez toute la pulpe avec les graines à l'aide d'une cuillère. Mélangez cette pulpe avec environ 100 ml d'eau. Mixez très brièvement (quelques secondes seulement) à l'aide d'un blender pour détacher la pulpe des graines sans les broyer. Passez la préparation à travers un tamis fin pour récupérer le jus et la pulpe sans les graines (les graines broyées peuvent être amères). Réservez le jus et la pulpe filtrés. 2. Suivez les étapes 1 à 5 de la "Préparation de la Base Commune". 3. Incorporez le jus de fruit de la passion et les arômes : Versez le jus de fruit de la passion filtré, le jus de citron et l'arôme (si utilisé) dans la grande marmite. Ajoutez quelques gouttes de colorant si vous souhaitez intensifier la couleur jaune-orangée. Si vous avez conservé quelques graines entières pour l'esthétique, ajoutez-les maintenant. Mélangez très bien l'ensemble. 4. Ajustement de la douceur : Prélevez une petite quantité du mélange, laissez-la refroidir un peu et goûtez. Le fruit de la passion est très acidulé, il est donc très probable que vous ayez besoin d'ajouter plus de sucre (jusqu'à 500g supplémentaires) pour équilibrer. Ajoutez le sucre cuillère par cuillère, en remuant jusqu'à dissolution complète, jusqu'à obtenir le goût désiré. 5. Terminez par les étapes de refroidissement, versement dans les moules et congélation de la préparation de base. Conseils Spécifiques : ● Qualité des Fruits : Utilisez des fruits de la passion bien ridés et lourds ; ce sont les signes qu'ils sont mûrs, juteux et pleins de saveur. ● Gestion des Graines : Le mixage très rapide et la filtration sont essentiels pour extraire un maximum de saveur sans introduire d'amertume due aux graines broyées. Garder quelques graines entières peut être un plus visuel. ● Ajustement du Sucre : C'est la saveur qui nécessite le plus d'attention pour le sucre. N'hésitez pas à ajuster progressivement et à goûter pour trouver l'équilibre parfait entre l'acidité du fruit et la douceur lactée. SALEXASYR3LL72ZB63T III. Les Rafraîchissements Pures et Gourmands (Sans Lait) Cette catégorie offre des bâtonnets de glace 100% à l'eau, conçus pour être ultra-doux, lisses et rafraîchissants. Ces recettes sont parfaites pour les palais sensibles aux produits laitiers ou pour une option plus légère.

R181 Recette 17 : Bâtonnets de Glace à l'Eau Ultra-Douce (Base Neutre)

Reference formulation — not released for production. Source S031, PDF page 34 through PDF page 36.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Cette recette constitue la base neutre pour tous vos bâtonnets de glace à l'eau sans lait. Sa polyvalence vous permet d'ajouter l'arôme et le colorant de votre choix pour créer une multitude de saveurs pures et rafraîchissantes. Ingrédients (pour 10 Litres de préparation) ● Eau filtrée ou bouillie et refroidie : 10 litres ● Sucre en poudre : 2,8 kg à 3 kg (commencez avec 2,8 kg et ajustez à votre goût ; cette quantité est cruciale pour la texture sans lait) ● Stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) : 10 à 15 grammes (votre allié indispensable pour une texture onctueuse et une fonte lente !) ● Extrait ou arôme liquide concentré de votre choix : 30 à 40 ml (par exemple : vanille, grenadine, menthe, citron, fraise, cola, mangue, orange, etc. – ajustez selon l'intensité désirée) ● Sel : Une pincée (environ 5g, pour rehausser subtilement les saveurs et équilibrer le sucre) ● Optionnel : Colorant alimentaire : Quelques gouttes (pour une couleur plus attrayante, adaptée à l'arôme choisi) ● Optionnel : Jus de citron frais : 1 à 2 cuillères à café (pour équilibrer la douceur si la glace est très sucrée ou si vous utilisez un arôme de fruit qui manque de peps) Préparation Étape par Étape 1. Préparer le sirop concentré : ○ Dans votre grande marmite, versez environ 2 litres d'eau (prélevée sur les 10 litres totaux). ○ Ajoutez-y les 2,8 kg de sucre en poudre . ○ Chauffez l'eau et le sucre à feu moyen, en remuant constamment avec votre fouet, jusqu'à ce que tout le sucre soit complètement dissous . Il est important de ne pas laisser bouillir le mélange, juste de le tiédir SALEXASYR3LL72ZB63T suffisamment pour dissoudre le sucre. Une fois le sucre dissous, retirez la marmite du feu. 2. Incorporer le stabilisateur (étape clé pour la texture !) : ○ C'est l'étape la plus importante pour garantir la douceur et l'absence de cristaux. Pour éviter la formation de grumeaux : Dans un petit bol sec, mélangez le stabilisateur pour glace (10 à 15g) avec environ 2 cuillères à soupe de sucre (prélevées sur le total). Ce mélange sec aide à bien disperser le stabilisateur. Alternativement, pour une dispersion optimale : prélevez environ 500 ml de l'eau tiède du sirop de sucre (de l'étape 1) dans un petit récipient. Saupoudrez lentement le mélange stabilisateur-sucre (ou le stabilisateur seul si vous êtes habitué) dans ce petit volume tout en mixant vigoureusement et continuellement avec un mixeur plongeant pendant au moins 1 à 2 minutes. Vous devriez obtenir un liquide légèrement épaissi et sans aucun grumeau. Versez ensuite ce mélange concentré de stabilisateur dans la grande marmite contenant le sirop de sucre tiède. Remuez énergiquement avec un grand fouet pendant 2 à 3 minutes pour bien l'incorporer à l'ensemble du volume. 3. Ajouter l'eau restante et le sel : ○ Incorporez les 8 litres d'eau froide restantes (ou le volume d'eau nécessaire pour atteindre 10 litres au total, en tenant compte du volume initial du sirop et de la dilution du stabilisateur) au mélange dans la marmite. ○ Ajoutez la pincée de sel . Mélangez bien pour homogénéiser. 4. Ajouter l'arôme et ajuster le goût : ○ Versez l' extrait ou l'arôme liquide concentré de votre choix (30 à 40 ml, à ajuster selon votre préférence d'intensité). ○ Si vous utilisez du colorant alimentaire , ajoutez-le maintenant, quelques gouttes à la fois, jusqu'à obtenir la couleur désirée. ○ Mélangez doucement mais soigneusement pour bien répartir les saveurs et la couleur. 5. Mixage final pour une homogénéité parfaite : ○ Pour une texture absolument parfaite et sans le moindre grain, utilisez votre mixeur plongeant directement dans la marmite pendant 2 à 3 minutes. Cela assurera une émulsion et une distribution uniforme de tous les ingrédients, crucial pour la douceur finale. Vous pouvez aussi, par petites quantités, transférer la préparation dans un blender puissant et mixer jusqu'à obtenir une consistance parfaitement homogène. 6.

Ajustement de la douceur (étape très importante !) : SALEXASYR3LL72ZB63T ○ C'est le moment d'affiner le goût. Prélevez une petite quantité du mélange, laissez-la refroidir un peu (si nécessaire) et goûtez. ○ Si vous préférez plus sucré, ajoutez le sucre restant (jusqu'à 3 kg au total si vous aviez commencé avec 2,8 kg), cuillère par cuillère, en remuant jusqu'à dissolution complète. ○ Si vous trouvez que c'est trop sucré ou si vous voulez un peu plus de peps (particulièrement avec des saveurs très douces), ajoutez le jus de citron (facultatif, 1 à 2 cuillères à café). Le citron apportera une note acidulée qui équilibre la douceur. 7. Refroidir complètement : ○ Laissez le mélange refroidir à température ambiante. Ensuite, placez la marmite (couverte) au réfrigérateur pendant au moins 2 à 3 heures, ou idéalement toute une nuit, jusqu'à ce qu'il soit très froid. Un mélange très froid avant congélation est essentiel pour minimiser la formation de gros cristaux de glace. 8. Verser dans les moules : ○ Une fois le mélange bien froid, versez-le dans vos moules à bâtonnets de glace ou vos sachets. Ne remplissez pas à ras bord ; laissez un petit espace (environ 1 cm) pour l'expansion lors de la congélation. 9. Congeler : ○ Placez les moules remplis au congélateur pendant au moins 6 à 8 heures, ou de préférence toute une nuit, jusqu'à ce qu'ils soient complètement fermes et durs.

R182 Recette 18 : Bâtonnets de Glace à l'Eau Goût Chocolat Intense

Reference formulation — not released for production. Source S031, PDF page 36 through PDF page 46.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Original source recipe evidence

(Sans Lait) Cette recette spécifique au chocolat est présentée séparément de la base neutre en raison de l'incorporation de la poudre de cacao. Le cacao, étant une poudre solide, nécessite une attention particulière lors du mélange pour assurer une dissolution parfaite et éviter toute texture granuleuse. De plus, sa couleur naturelle et son amertume imposent des ajustements spécifiques dans l'équilibre des saveurs et l'utilisation des colorants. Ingrédients (pour 10 Litres de préparation) ● Eau filtrée ou bouillée et refroidie : 10 litres ● Sucre en poudre : 2,8 kg à 3 kg (ajustez à votre goût ; commencez avec 2,8 kg) ● Stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) : 10 à 15 grammes ● Sel : Une pincée (environ 5g) SALEXASYR3LL72ZB63T ● Poudre de cacao non sucrée de bonne qualité : 250 grammes (pour une saveur chocolat intense) ● Extrait de vanille (facultatif) : 20 ml (pour sublimer et approfondir les notes de chocolat) ● Arôme chocolat liquide concentré (facultatif) : 10 à 20 ml (pour une saveur chocolat plus prononcée ou spécifique, en complément du cacao) ● Optionnel : Colorant alimentaire brun/chocolat : Quelques gouttes (pour intensifier ou ajuster la teinte du chocolat) Préparation Étape par Étape 1. Préparer le mélange sec avec la poudre de cacao : Dans un grand saladier, mélangez soigneusement les 2,8 kg de sucre en poudre , la pincée de sel et les 250 grammes de poudre de cacao non sucrée . Assurez-vous que le cacao est parfaitement incorporé aux autres poudres pour faciliter sa dissolution et éviter la formation de grumeaux. 2. Préparer le sirop concentré : Dans votre grande marmite, versez environ 2 litres d'eau (prélevée sur les 10 litres totaux). Ajoutez-y le mélange sec cacao-sucre-sel préparé à l'étape précédente. Chauffez l'eau et le mélange à feu moyen, en remuant constamment avec votre fouet, jusqu'à ce que tout le sucre et le cacao soient complètement dissous . Ne laissez pas bouillir. Une fois dissous, retirez la marmite du feu. 3. Incorporer le stabilisateur : Procédez comme décrit à l'étape 2 de la "Préparation Étape par Étape (Base Commune)" (en dispersant le stabilisateur dans un peu de liquide tiède du sirop avant de l'incorporer à la marmite). Assurez un mixage vigoureux avec le mixeur plongeant. 4. Ajouter l'eau restante et les arômes : Incorporez les 8 litres d'eau froide restantes (ou le volume nécessaire pour atteindre 10 litres au total). Ajoutez l' extrait de vanille (si utilisé) et l' arôme chocolat liquide concentré (si utilisé). Si vous utilisez du colorant alimentaire brun/chocolat, ajoutez-le maintenant , quelques gouttes à la fois, jusqu'à obtenir la teinte désirée. Mélangez bien. 5. Mixage final pour une homogénéité parfaite : Effectuez un mixage prolongé avec le mixeur plongeant (comme à l'étape 5 de la "Préparation Étape par Étape (Base Commune)") pendant 2 à 3 minutes. C'est absolument crucial pour garantir une texture lisse et homogène, sans aucun morceau ou grumeau de cacao. 6. Ajustement de la douceur : Goûtez une petite quantité du mélange (refroidit). Le cacao a une amertume naturelle qui nécessite un bon équilibre. Vous pourriez souhaiter ajouter le sucre restant (jusqu'à 3 kg au total) pour compenser et SALEXASYR3LL72ZB63T atteindre la douceur désirée. Ajoutez cuillère par cuillère en remuant bien jusqu'à dissolution complète. 7. Refroidir complètement : Laissez le mélange refroidir à température ambiante, puis placez la marmite (couverte) au réfrigérateur pendant au moins 2 à 3 heures, ou idéalement toute une nuit, jusqu'à ce qu'il soit très froid. 8. Verser dans les moules et Congeler : Procédez comme aux étapes 8 et 9 de la "Préparation Étape par Étape (Base Commune)". Conseils Spécifiques pour une Glace au Chocolat à l'Eau : ● Qualité du Cacao : L'utilisation d'une poudre de cacao de bonne qualité est primordiale pour un goût chocolaté riche et non terreux.

Préférez un cacao pur et non sucré, de type hollandais (Dutch-processed) si possible, car il se dissout mieux. ● Dissolution du Cacao : Le cacao peut être difficile à dissoudre. Le secret est de le mélanger d'abord avec le sucre à sec, puis de l'incorporer dans un liquide tiède, et enfin d'utiliser intensément le mixeur plongeant pour une texture parfaitement lisse. ● Arôme Chocolat (Optionnel) : Cet arôme est un excellent complément si vous désirez une saveur chocolatée encore plus prononcée, spécifique (par exemple, plus douce ou plus foncée), ou si le cacao utilisé n'est pas très aromatique. Goûtez et ajustez la quantité selon vos préférences. ● Ajustement du Sucre : Le cacao apporte une amertume caractéristique. N'hésitez pas à ajuster la quantité de sucre final selon vos préférences pour équilibrer la saveur chocolatée. ● Colorant Chocolat (Optionnel) : Bien que la poudre de cacao donne déjà une couleur marron naturelle, un colorant alimentaire brun/chocolat peut être ajouté pour intensifier la teinte ou obtenir une couleur plus uniforme si le cacao utilisé est clair.

R183 RECETTE 1 — MAGNUM VANILLE

Reference formulation — not released for production. Source S036, PDF page 4 through PDF page 6.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

La classique indémodable. Base crémeuse vanillée, enrobage chocolat noir croquant. INGRÉDIENTS Ingrédient Quantité Unité Eau froide 6 L Lait en poudre entier (min. 26 % MG) 600 g Lait concentré sucré 400 g Sucre cristallisé 2 000 g Margarine ou beurre doux fondu 150 g Stabilisant CMC ou gomme xanthane 12 g Émulsifiant (lécithine de soja) 15 g Sel fin 2 g Arôme vanille liquide 4 à 5 g Chocolat de couverture noir 70 % (enrobage) 1 000 g Huile végétale neutre (enrobage) 250 g

ÉTAPES DE PRÉPARATION Étape 1 — Pré-mélange sec (CRITIQUE) Dans un grand seau propre et sec, mélanger à sec : sucre + lait en poudre + stabilisant. Mélanger à la cuillère 2 minutes jusqu'à mélange uniforme. NE JAMAIS verser le stabilisant directement dans l'eau — grumeaux irréversibles garantis. Étape 2 — Incorporation des liquides Verser l'eau froide progressivement sur le mélange sec en fouettant sans arrêt. Ajouter le lait concentré sucré puis le sel. Fouetter jusqu'à dissolution totale du sucre — aucun grain ne doit subsister au toucher. Étape 3 — Ajout de la matière grasse Faire fondre la margarine ou le beurre à feu doux (ne pas faire bouillir). Verser en filet continu dans le mélange en fouettant. Rôle : onctuosité, réduction des cristaux, corps crémeux typique du Magnum. Étape 4 — Mixage intensif Mixer au mixeur plongeant ou blender 2 à 3 minutes à vitesse maximale. La base doit être lisse, légèrement nacrée, sans trace de gras visible en surface. Étape 5 — Battage à l'émulsifiant — ÉTAPE CLÉ SALEXASYR3LL72ZB63T

Ajouter l'émulsifiant dans la base. Battre au fouet électrique 5 à 7 minutes à vitesse élevée. Résultat attendu : volume +20 à 30 %, texture mousseuse, couleur plus claire. Cette étape remplace la turbine à glace — ne jamais la sauter. Étape 6 — Repos du mix Couvrir et laisser reposer 10 à 15 minutes. Le stabilisant achève son action, les molécules s'organisent, la texture se fixe. Étape 7 — Aromatisation Ajouter 4 à 5 g d'arôme vanille liquide (ou 2 gousses de vanille grattées pour version premium). Incorporer délicatement à la spatule — mouvement de bas en haut, sans battre. Étape 8 — Retrait de la mousse Retirer délicatement à la spatule la mousse épaisse en surface (2 à 3 cm). Cette mousse crée des trous dans le picolé et le fragilise. Ne retirer que la mousse instable visible, pas la texture aérée légère du mix. Étape 9 — Moulage Verser dans les moules légèrement humidifiés. Remplir à 90 % seulement — la glace se dilate en congelant. Tapoter chaque moule 3 à 4 fois pour chasser les bulles d'air. Étape 10 — Pré-congélation et insertion des bâtonnets Placer au congélateur 2 à 3 heures. Vérifier après 1h30 : quand semi-solide (s'enfonce légèrement au doigt), insérer les bâtonnets en bois à la verticale et au centre exact du moule. Étape 11 — Congélation finale Laisser au congélateur 10 à 12 heures minimum, idéalement une nuit complète. Ne pas ouvrir fréquemment — les variations de température dégradent la qualité. Étape 12 — Démoulage Tremper le bas des moules dans l'eau à température ambiante (pas chaude) 3 à 5 secondes exactement. Tenir le bâtonnet fermement et tirer verticalement sans forcer. Si résistance, retremper 2 secondes. Étape 13 — Préparation de l'enrobage chocolat Faire fondre 1 000 g de chocolat de couverture au bain-marie jusqu'à 45°C (chocolat blanc : 40°C). Ajouter 250 g d'huile végétale neutre en filet. Mélanger jusqu'à texture fluide et nappante. Trop liquide → réduire l'huile. Trop épais → ajouter 20 g d'huile. Étape 14 — Enrobage et finition Sortir les picolés un par un — remettre les autres immédiatement au froid. Tremper dans le chocolat fondu d'un mouvement plongeant continu. Égoutter 2 secondes. La coque se solidifie en 3 à 5 secondes. Poser sur papier sulfurisé.

SALEXASYR3LL72ZB63T

CONSEILS SPÉCIFIQUES

• Toujours ajouter l'arôme APRÈS le repos — la chaleur résiduelle évapore les notes aromatiques.

• Version premium : combiner arôme liquide (5 g) + 2 gousses grattées pour saveur complexe et

profonde.

• La vanille se marie parfaitement avec le chocolat noir 70 % — éviter le chocolat au lait qui écrase la

saveur.

• Dosage précis : 4 g pour saveur douce, 5 g pour saveur marquée. Ne pas dépasser 6 g (goût artificiel).

• Si la couleur paraît trop blanche : ajouter 1 g de colorant jaune alimentaire pour teinte naturelle.

• Conservation : 3 mois à -18°C minimum en sachet hermétique.

SALEXASYR3LL72ZB63T

R184 RECETTE 2 — MAGNUM FRAISE

Reference formulation — not released for production. Source S036, PDF page 7 through PDF page 9.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Fraise acidulée et fruitée sur base crémeuse. Couleur rose naturelle, best-seller tropical. INGRÉDIENTS Ingrédient Quantité Unité Eau froide 6 L Lait en poudre entier (min. 26 % MG) 600 g Lait concentré sucré 400 g Sucre cristallisé (réduit — poudre fraise est sucrée) 1 900 g Margarine ou beurre doux fondu 150 g Stabilisant CMC ou gomme xanthane 12 g Émulsifiant (lécithine de soja) 15 g Sel fin 2 g Poudre de jus de fraise/300g de jus de fraise 100 à 120 (pour la poudre) ou 300 (pour le jus) g Arôme fraise liquide 3 g Chocolat de couverture noir ou blanc (enrobage) 1 000 g Huile végétale neutre (enrobage) 250 g

ÉTAPES DE PRÉPARATION Étape 1 — Pré-mélange sec (CRITIQUE) Dans un grand seau propre et sec, mélanger à sec : sucre + lait en poudre + stabilisant. Mélanger à la cuillère 2 minutes jusqu'à mélange uniforme. NE JAMAIS verser le stabilisant directement dans l'eau — grumeaux irréversibles garantis. Étape 2 — Incorporation des liquides Verser l'eau froide progressivement sur le mélange sec en fouettant sans arrêt. Ajouter le lait concentré sucré puis le sel. Fouetter jusqu'à dissolution totale du sucre — aucun grain ne doit subsister au toucher. Étape 3 — Ajout de la matière grasse Faire fondre la margarine ou le beurre à feu doux (ne pas faire bouillir). Verser en filet continu dans le mélange en fouettant. Rôle : onctuosité, réduction des cristaux, corps crémeux typique du Magnum. Étape 4 — Mixage intensif Mixer au mixeur plongeant ou blender 2 à 3 minutes à vitesse maximale. La base doit être lisse, légèrement nacrée, sans trace de gras visible en surface. SALEXASYR3LL72ZB63T

Étape 5 — Battage à l'émulsifiant — ÉTAPE CLÉ Ajouter l'émulsifiant dans la base. Battre au fouet électrique 5 à 7 minutes à vitesse élevée. Résultat attendu : volume +20 à 30 %, texture mousseuse, couleur plus claire. Cette étape remplace la turbine à glace — ne jamais la sauter. Étape 6 — Repos du mix Couvrir et laisser reposer 10 à 15 minutes. Le stabilisant achève son action, les molécules s'organisent, la texture se fixe. Étape 7 — Aromatisation Ajouter simultanément 100 à 120 g de poudre de jus de fraise + 3 g d'arôme fraise liquide. Incorporer délicatement à la spatule. La base prend une couleur rose pâle à rose vif. Pour couleur plus intense : ajouter 2 g de colorant rouge alimentaire. Goûter et ajuster. Étape 8 — Retrait de la mousse Retirer délicatement à la spatule la mousse épaisse en surface (2 à 3 cm). Cette mousse crée des trous dans le picolé et le fragilise. Ne retirer que la mousse instable visible, pas la texture aérée légère du mix. Étape 9 — Moulage Verser dans les moules légèrement humidifiés. Remplir à 90 % seulement — la glace se dilate en congelant. Tapoter chaque moule 3 à 4 fois pour chasser les bulles d'air. Étape 10 — Pré-congélation et insertion des bâtonnets Placer au congélateur 2 à 3 heures. Vérifier après 1h30 : quand semi-solide (s'enfonce légèrement au doigt), insérer les bâtonnets en bois à la verticale et au centre exact du moule. Étape 11 — Congélation finale Laisser au congélateur 10 à 12 heures minimum, idéalement une nuit complète. Ne pas ouvrir fréquemment — les variations de température dégradent la qualité. Étape 12 — Démoulage Tremper le bas des moules dans l'eau à température ambiante (pas chaude) 3 à 5 secondes exactement. Tenir le bâtonnet fermement et tirer verticalement sans forcer. Si résistance, retremper 2 secondes. Étape 13 — Préparation de l'enrobage chocolat Faire fondre 1 000 g de chocolat de couverture au bain-marie jusqu'à 45°C (chocolat blanc : 40°C). Ajouter 250 g d'huile végétale neutre en filet. Mélanger jusqu'à texture fluide et nappante. Trop liquide → réduire l'huile. Trop épais → ajouter 20 g d'huile. Étape 14 — Enrobage et finition Sortir les picolés un par un — remettre les autres immédiatement au froid. Tremper dans le chocolat fondu d'un mouvement plongeant continu. Égoutter 2 secondes. La coque se solidifie en 3 à 5 secondes. Poser sur papier sulfurisé. SALEXASYR3LL72ZB63T

CONSEILS SPÉCIFIQUES

• Réduire le sucre à 1 900 g — la poudre de fraise apporte déjà du sucre.

• Ajouter poudre ET arôme simultanément pour une saveur homogène.

• Si la base paraît trop dense après incorporation : mixer 30 secondes supplémentaires.

• Enrobage chocolat blanc (40°C + 200 g d'huile) : contraste visuel rose/blanc très attractif.

• Enrobage chocolat noir (45°C + 250 g d'huile) : contraste rouge/noir très vendeur en rue.

• Conseil business : la fraise se vend souvent aussi vite que la vanille — toujours avoir du stock.

• Conservation : 2,5 mois max à -18°C.

SALEXASYR3LL72ZB63T

R185 RECETTE 3 — MAGNUM COCO

Reference formulation — not released for production. Source S036, PDF page 10 through PDF page 12.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Douceur exotique, base crémeuse à la noix de coco, enrobage chocolat blanc. INGRÉDIENTS Ingrédient Quantité Unité Eau froide 6 L Lait en poudre entier (min. 26 % MG) 600 g Lait concentré sucré 400 g Sucre cristallisé 2 000 g Margarine ou beurre doux fondu 150 g Stabilisant CMC ou gomme xanthane 12 g Émulsifiant (lécithine de soja) 15 g Sel fin 2 g Noix de coco râpée finement 200 g Arôme coco liquide 4 g Chocolat de couverture blanc (enrobage) 1 000 g Huile végétale neutre (enrobage) 200 g

ÉTAPES DE PRÉPARATION Étape 1 — Pré-mélange sec (CRITIQUE) Dans un grand seau propre et sec, mélanger à sec : sucre + lait en poudre + stabilisant. Mélanger à la cuillère 2 minutes jusqu'à mélange uniforme. NE JAMAIS verser le stabilisant directement dans l'eau — grumeaux irréversibles garantis. Étape 2 — Incorporation des liquides Verser l'eau froide progressivement sur le mélange sec en fouettant sans arrêt. Ajouter le lait concentré sucré puis le sel. Fouetter jusqu'à dissolution totale du sucre — aucun grain ne doit subsister au toucher. Étape 3 — Ajout de la matière grasse Faire fondre la margarine ou le beurre à feu doux (ne pas faire bouillir). Verser en filet continu dans le mélange en fouettant. Rôle : onctuosité, réduction des cristaux, corps crémeux typique du Magnum. Étape 4 — Mixage intensif Mixer au mixeur plongeant ou blender 2 à 3 minutes à vitesse maximale. La base doit être lisse, légèrement nacrée, sans trace de gras visible en surface. Étape 5 — Battage à l'émulsifiant — ÉTAPE CLÉ SALEXASYR3LL72ZB63T

Ajouter l'émulsifiant dans la base. Battre au fouet électrique 5 à 7 minutes à vitesse élevée. Résultat attendu : volume +20 à 30 %, texture mousseuse, couleur plus claire. Cette étape remplace la turbine à glace — ne jamais la sauter. Étape 6 — Repos du mix Couvrir et laisser reposer 10 à 15 minutes. Le stabilisant achève son action, les molécules s'organisent, la texture se fixe. Étape 7 — Aromatisation Ajouter 80 g de noix de coco râpée finement + 4 g d'arôme coco liquide. Bien mélanger à la spatule — la coco doit être répartie uniformément dans toute la base. Si la coco râpée est grossière, la mixer 10 secondes avant incorporation. Étape 8 — Retrait de la mousse Retirer délicatement à la spatule la mousse épaisse en surface (2 à 3 cm). Cette mousse crée des trous dans le picolé et le fragilise. Ne retirer que la mousse instable visible, pas la texture aérée légère du mix. Étape 9 — Moulage Verser dans les moules légèrement humidifiés. Remplir à 90 % seulement — la glace se dilate en congelant. Tapoter chaque moule 3 à 4 fois pour chasser les bulles d'air. Étape 10 — Pré-congélation et insertion des bâtonnets Placer au congélateur 2 à 3 heures. Vérifier après 1h30 : quand semi-solide (s'enfonce légèrement au doigt), insérer les bâtonnets en bois à la verticale et au centre exact du moule. Étape 11 — Congélation finale Laisser au congélateur 10 à 12 heures minimum, idéalement une nuit complète. Ne pas ouvrir fréquemment — les variations de température dégradent la qualité. Étape 12 — Démoulage Tremper le bas des moules dans l'eau à température ambiante (pas chaude) 3 à 5 secondes exactement. Tenir le bâtonnet fermement et tirer verticalement sans forcer. Si résistance, retremper 2 secondes. Étape 13 — Préparation de l'enrobage chocolat Faire fondre 1 000 g de chocolat de couverture au bain-marie jusqu'à 45°C (chocolat blanc : 40°C). Ajouter 250 g d'huile végétale neutre en filet. Mélanger jusqu'à texture fluide et nappante. Trop liquide → réduire l'huile. Trop épais → ajouter 20 g d'huile. Étape 14 — Enrobage et finition Sortir les picolés un par un — remettre les autres immédiatement au froid. Tremper dans le chocolat fondu d'un mouvement plongeant continu. Égoutter 2 secondes. La coque se solidifie en 3 à 5 secondes. Poser sur papier sulfurisé.

SALEXASYR3LL72ZB63T

CONSEILS SPÉCIFIQUES

• Utiliser de la coco râpée FINEMENT — la coco grossière remonte et crée des irrégularités dans le

picolé.

• Enrobage chocolat blanc obligatoire — renforce la saveur et l'aspect visuel.

• Chocolat blanc pour l'enrobage : fondre à 40°C maximum, ajouter 200 g d'huile seulement.

• Option premium : saupoudrer un peu de coco râpée sur l'enrobage encore liquide pour effet décoratif.

• La coco absorbe légèrement l'humidité — si la texture paraît moins mousseuse, ajouter 5 g

d'émulsifiant.

• Saveur très populaire en Afrique centrale — idéale pour se différencier de la concurrence.

• Conservation : 3 mois à -18°C en sachet hermétique.

SALEXASYR3LL72ZB63T

R186 RECETTE 4 — MAGNUM ANANAS

Reference formulation — not released for production. Source S036, PDF page 13 through PDF page 15.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Saveur tropicale acidulée, base fruitée intense, enrobage chocolat blanc. INGRÉDIENTS Ingrédient Quantité Unité Eau froide 6 L Lait en poudre entier (min. 26 % MG) 600 g Lait concentré sucré 400 g Sucre cristallisé (réduit — ananas est sucré et acide) 1 850 g Margarine ou beurre doux fondu 150 g Stabilisant CMC ou gomme xanthane 12 g Émulsifiant (lécithine de soja) 15 g Sel fin 2 g Jus d'ananas concentré 150 g Poudre d'ananas déshydraté/ou jus ananas 100(poudre) ou 300(jus) g Chocolat de couverture blanc (enrobage) 1 000 g Huile végétale neutre (enrobage) 200 g

ÉTAPES DE PRÉPARATION Étape 1 — Pré-mélange sec (CRITIQUE) Dans un grand seau propre et sec, mélanger à sec : sucre + lait en poudre + stabilisant. Mélanger à la cuillère 2 minutes jusqu'à mélange uniforme. NE JAMAIS verser le stabilisant directement dans l'eau — grumeaux irréversibles garantis. Étape 2 — Incorporation des liquides Verser l'eau froide progressivement sur le mélange sec en fouettant sans arrêt. Ajouter le lait concentré sucré puis le sel. Fouetter jusqu'à dissolution totale du sucre — aucun grain ne doit subsister au toucher. Étape 3 — Ajout de la matière grasse Faire fondre la margarine ou le beurre à feu doux (ne pas faire bouillir). Verser en filet continu dans le mélange en fouettant. Rôle : onctuosité, réduction des cristaux, corps crémeux typique du Magnum. Étape 4 — Mixage intensif Mixer au mixeur plongeant ou blender 2 à 3 minutes à vitesse maximale. La base doit être lisse, légèrement nacrée, sans trace de gras visible en surface. SALEXASYR3LL72ZB63T

Étape 5 — Battage à l'émulsifiant — ÉTAPE CLÉ Ajouter l'émulsifiant dans la base. Battre au fouet électrique 5 à 7 minutes à vitesse élevée. Résultat attendu : volume +20 à 30 %, texture mousseuse, couleur plus claire. Cette étape remplace la turbine à glace — ne jamais la sauter. Étape 6 — Repos du mix Couvrir et laisser reposer 10 à 15 minutes. Le stabilisant achève son action, les molécules s'organisent, la texture se fixe. Étape 7 — Aromatisation Ajouter 150 g de jus d'ananas concentré + 80 g de poudre d'ananas déshydraté. Incorporer délicatement à la spatule. ATTENTION : le jus d'ananas est acide — il peut légèrement déstabiliser la texture. Travailler rapidement et mouler sans attendre. Étape 8 — Retrait de la mousse Retirer délicatement à la spatule la mousse épaisse en surface (2 à 3 cm). Cette mousse crée des trous dans le picolé et le fragilise. Ne retirer que la mousse instable visible, pas la texture aérée légère du mix. Étape 9 — Moulage Verser dans les moules légèrement humidifiés. Remplir à 90 % seulement — la glace se dilate en congelant. Tapoter chaque moule 3 à 4 fois pour chasser les bulles d'air. Étape 10 — Pré-congélation et insertion des bâtonnets Placer au congélateur 2 à 3 heures. Vérifier après 1h30 : quand semi-solide (s'enfonce légèrement au doigt), insérer les bâtonnets en bois à la verticale et au centre exact du moule. Étape 11 — Congélation finale Laisser au congélateur 10 à 12 heures minimum, idéalement une nuit complète. Ne pas ouvrir fréquemment — les variations de température dégradent la qualité. Étape 12 — Démoulage Tremper le bas des moules dans l'eau à température ambiante (pas chaude) 3 à 5 secondes exactement. Tenir le bâtonnet fermement et tirer verticalement sans forcer. Si résistance, retremper 2 secondes. Étape 13 — Préparation de l'enrobage chocolat Faire fondre 1 000 g de chocolat de couverture au bain-marie jusqu'à 45°C (chocolat blanc : 40°C). Ajouter 250 g d'huile végétale neutre en filet. Mélanger jusqu'à texture fluide et nappante. Trop liquide → réduire l'huile. Trop épais → ajouter 20 g d'huile. Étape 14 — Enrobage et finition Sortir les picolés un par un — remettre les autres immédiatement au froid. Tremper dans le chocolat fondu d'un mouvement plongeant continu. Égoutter 2 secondes. La coque se solidifie en 3 à 5 secondes. Poser sur papier sulfurisé. SALEXASYR3LL72ZB63T

CONSEILS SPÉCIFIQUES

• Réduire le sucre à 1 850 g — l'ananas est naturellement sucré et acide.

• CRITIQUE : l'acidité de l'ananas peut altérer la texture — mouler dans les 5 minutes après

incorporation.

• Ne jamais utiliser de jus d'ananas frais non concentré : trop liquide, déséquilibre la formule.

• Enrobage chocolat blanc obligatoire : le chocolat noir contraste mal avec l'ananas en termes de

saveur.

• Pour couleur jaune plus vive : ajouter 2 g de colorant jaune alimentaire.

• Option décorative : quelques morceaux d'ananas séché sur l'enrobage encore liquide.

• Conservation : 2,5 mois max à -18°C — l'acide réduit légèrement la durée de conservation.

SALEXASYR3LL72ZB63T

R187 RECETTE 5 — MAGNUM BANANE

Reference formulation — not released for production. Source S036, PDF page 16 through PDF page 20.

Review decision: Retain flavour/formula difference; do not adopt the stated volume as mass yield. Whole powder is not Millac by default; concentrated milk, stabilizer and emulsifier identities/doses need specification. Heating only when eggs are present, brief unvalidated pot holds, raw post-heat fruit additions and assumed weeks of storage are not approved. Source-specific commercial-use terms are recorded in the original file; this is an internal working comparison.

Original source recipe evidence

Onctuosité tropicale, banane mûre intense, enrobage chocolat au lait ou noir. INGRÉDIENTS Ingrédient Quantité Unité Eau froide 6 L Lait en poudre entier (min. 26 % MG) 600 g Lait concentré sucré 400 g Sucre cristallisé (réduit — banane est sucrée) 1 900 g Margarine ou beurre doux fondu 150 g Stabilisant CMC ou gomme xanthane 12 g Émulsifiant (lécithine de soja) 15 g Sel fin 2 g Bananes très mûres mixées (chair uniquement) 200 g Arôme banane liquide 3 g Chocolat de couverture au lait ou noir (enrobage) 1 000 g Huile végétale neutre (enrobage) 250 g

ÉTAPES DE PRÉPARATION Étape 1 — Pré-mélange sec (CRITIQUE) Dans un grand seau propre et sec, mélanger à sec : sucre + lait en poudre + stabilisant. Mélanger à la cuillère 2 minutes jusqu'à mélange uniforme. NE JAMAIS verser le stabilisant directement dans l'eau — grumeaux irréversibles garantis. Étape 2 — Incorporation des liquides Verser l'eau froide progressivement sur le mélange sec en fouettant sans arrêt. Ajouter le lait concentré sucré puis le sel. Fouetter jusqu'à dissolution totale du sucre — aucun grain ne doit subsister au toucher. Étape 3 — Ajout de la matière grasse Faire fondre la margarine ou le beurre à feu doux (ne pas faire bouillir). Verser en filet continu dans le mélange en fouettant. Rôle : onctuosité, réduction des cristaux, corps crémeux typique du Magnum. Étape 4 — Mixage intensif Mixer au mixeur plongeant ou blender 2 à 3 minutes à vitesse maximale. La base doit être lisse, légèrement nacrée, sans trace de gras visible en surface. SALEXASYR3LL72ZB63T

Étape 5 — Battage à l'émulsifiant — ÉTAPE CLÉ Ajouter l'émulsifiant dans la base. Battre au fouet électrique 5 à 7 minutes à vitesse élevée. Résultat attendu : volume +20 à 30 %, texture mousseuse, couleur plus claire. Cette étape remplace la turbine à glace — ne jamais la sauter. Étape 6 — Repos du mix Couvrir et laisser reposer 10 à 15 minutes. Le stabilisant achève son action, les molécules s'organisent, la texture se fixe. Étape 7 — Aromatisation Mixer 2 bananes très mûres (200 g de chair) jusqu'à purée lisse sans morceaux. Ajouter la purée + 3 g d'arôme banane liquide dans le mix reposé. Incorporer délicatement à la spatule. La base prend une couleur crème à jaune pâle. Étape 8 — Retrait de la mousse Retirer délicatement à la spatule la mousse épaisse en surface (2 à 3 cm). Cette mousse crée des trous dans le picolé et le fragilise. Ne retirer que la mousse instable visible, pas la texture aérée légère du mix. Étape 9 — Moulage Verser dans les moules légèrement humidifiés. Remplir à 90 % seulement — la glace se dilate en congelant. Tapoter chaque moule 3 à 4 fois pour chasser les bulles d'air. Étape 10 — Pré-congélation et insertion des bâtonnets Placer au congélateur 2 à 3 heures. Vérifier après 1h30 : quand semi-solide (s'enfonce légèrement au doigt), insérer les bâtonnets en bois à la verticale et au centre exact du moule. Étape 11 — Congélation finale Laisser au congélateur 10 à 12 heures minimum, idéalement une nuit complète. Ne pas ouvrir fréquemment — les variations de température dégradent la qualité. Étape 12 — Démoulage Tremper le bas des moules dans l'eau à température ambiante (pas chaude) 3 à 5 secondes exactement. Tenir le bâtonnet fermement et tirer verticalement sans forcer. Si résistance, retremper 2 secondes. Étape 13 — Préparation de l'enrobage chocolat Faire fondre 1 000 g de chocolat de couverture au bain-marie jusqu'à 45°C (chocolat blanc : 40°C). Ajouter 250 g d'huile végétale neutre en filet. Mélanger jusqu'à texture fluide et nappante. Trop liquide → réduire l'huile. Trop épais → ajouter 20 g d'huile. Étape 14 — Enrobage et finition Sortir les picolés un par un — remettre les autres immédiatement au froid. Tremper dans le chocolat fondu d'un mouvement plongeant continu. Égoutter 2 secondes. La coque se solidifie en 3 à 5 secondes. Poser sur papier sulfurisé. SALEXASYR3LL72ZB63T

CONSEILS SPÉCIFIQUES

• Utiliser des bananes TRÈS MÛRES (peau tachetée de noir) — la saveur est 3 fois plus intense.

• Mixer la banane en purée parfaitement lisse — les morceaux créent des points durs congelés.

• Réduire le sucre à 1 900 g — la banane mûre apporte naturellement beaucoup de sucre.

• L'arôme banane (3 g) est indispensable : la banane seule perd beaucoup de saveur à la congélation.

• Enrobage chocolat au lait : association classique banane-chocolat très appréciée.

• Enrobage chocolat noir : contraste plus sophistiqué pour clientèle adulte.

• Travailler rapidement après incorporation — la banane s'oxyde et noircit à l'air.

• Conservation : 2 mois max à -18°C.

R188 Simple Vanilla Ice Cream

Reference formulation — not released for production. Source S127, PDF page 6 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

6 Simple Vanilla Ice Cream This ice cream can easily be dressed up by adding your favourite chopped lollies, chopped chocolate or berries at the end of churning. Makes about 5 cups (ten ½-cup servings) 1½ cups full cream milk 1 cup white sugar pinch flaked salt 2½ cups thickened cream 1 tablespoon pure vanilla extract

1. In a medium bowl, use a hand mixer on low

speed or whisk to combine the milk, sugar and salt until the sugar is dissolved. Stir in the thickened cream and vanilla. Cover and refrigerate a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

2. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Simple Chocolate Ice Cream For a real treat, serve this with our Hot Fudge Sauce on page 18. Makes about 5 cups (ten ½-cup servings) ¾ cup cocoa powder, sifted ½ cup white sugar ⅓ cup packed brown sugar pinch flaked salt 1 cup full cream milk 2 cups thickened cream 2 teaspoons pure vanilla extract

1. In a medium bowl, whisk together the cocoa,

sugars and salt. Add the milk and, using a hand mixer on low speed or a whisk, beat to combine until the cocoa, sugars and salt are dissolved. Stir in the thickened cream and vanilla. Cover and refrigerate for a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

2. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. SIMPLE ICE CREAMS

R190 Butter Pecan Ice Cream

Reference formulation — not released for production. Source S127, PDF page 7 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

7 Butter Pecan Ice Cream The butter used to toast the pecans can be saved and reheated to drizzle over pancakes or waffles. Makes about 5 cups (ten ½-cup servings) 2 tablespoons unsalted butter 1 cup pecans (halves, pieces or whole) 1 teaspoon flaked salt 1 cup full cream milk ¾ cup white sugar pinch flaked salt 2 cups thickened cream 1 tablespoon pure vanilla extract

1. Melt the butter in a medium fry pan. Add the

pecans and 1 teaspoon of salt. Cook over medium-low heat until pecans are toasted and golden, stirring frequently, about 6 to 8 minutes. Remove from the heat, strain and reserve the pecans, allowing them to chill. The butter can be used for another use – delicious over pancakes or waffles.

2. In a medium bowl, use a hand mixer on low

speed or whisk to combine the milk, sugar and pinch of salt until the sugar is dissolved. Stir in the thickened cream and vanilla. Cover and refrigerate for a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

3. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. Five minutes before mixing is completed, add the reserved pecans through the mix-in opening and let mix in completely. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Fresh Strawberry Ice Cream Best made when strawberries are at their peak in season, this ice cream is light, sweet and fruity. Makes about 5½ cups (eleven ½-cup servings) 1½ cups fresh strawberries, hulled* ¾ cup full cream milk ⅔ cup white sugar pinch flaked salt 1½ cups thickened cream 2 teaspoons pure vanilla extract

1. Put the strawberries into the bowl of a

food processor fitted with the chopping blade. Pulse strawberries until rough/finely chopped (depending on preference). Reserve in bowl.

2. In a medium bowl, use a hand mixer on

low speed or whisk to combine the milk, sugar and salt until the sugar is dissolved. Stir in the thickened cream and vanilla. Stir in reserved strawberries with all juices. Cover and refrigerate for a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

3. Pour the mixture into the mixing bowl

of the Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. * Frozen strawberries may be substituted if fresh strawberries are not available.

R192 Vanilla Bean Ice Cream

Reference formulation — not released for production. Source S127, PDF page 8 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

8 Vanilla Bean Ice Cream For the true vanilla lover. Be sure to use fresh vanilla beans to capture the intense flavour. Makes about 5 cups (ten ½-cup servings) 2 cups full cream milk 2 cups thickened cream 1 cup white sugar, divided pinch sea salt 1 whole vanilla bean, halved and seeds scraped 5 large egg yolks 2 teaspoons pure vanilla extract

1. In a medium saucepan, whisk together the

milk, cream, half of the sugar, salt and the scraped vanilla bean (including the pod). Place over medium heat and bring to a gentle simmer.

2. While the milk/cream mixture is heating,

combine the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or whisk, beat until mixture is pale and thick.

3. Once the milk/cream mixture has come to a

gentle simmer, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon, stir the mixture constantly over low heat until it thickens slightly and coats the back of the spoon. This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Pour the mixture through a fine mesh strainer

(discard the vanilla pod) into a jug or bowl. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Stir in the vanilla. Recover and refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Note – when custard is ready it will leave a thin layer on the back of the wooden spoon. Run your finger down the length of the spoon and should leave a line. Your custard is now ready. Buttermilk Ice Cream This slightly tangy ice cream is a perfect match with a slice of warm apple pie. Makes about 5 cups (ten ½-cup servings) 2 cups thickened cream 1 cup white sugar, divided pinch sea salt 2 teaspoons pure vanilla extract 6 large egg yolks 2 cups buttermilk

1. Put the cream, half of the sugar, salt and

vanilla extract in a medium saucepan. Whisk to combine and place over medium heat and bring to a gentle simmer.

2. While the cream mixture is heating, combine

the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or whisk, beat until mixture is pale and thick.

3. Once the cream mixture has come to a gentle

boil, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon (see note in previous recipe). This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Pour the mixture through a fine mesh strainer

into a jug or bowl, whisk in the buttermilk. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk CUSTARD-STYLE ICE CREAMS

R194 Fresh Mint With Chocolate Cookies

Reference formulation — not released for production. Source S127, PDF page 9 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

9 mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Fresh Mint with Chocolate Cookies Always a winning combination, fresh mint and chocolate take the forefront in this rich and creamy ice cream. Makes about 6 cups (twelve ½-cup servings) 2 cups full cream milk 2 cups thickened cream 1 cup white sugar, divided pinch flaked salt 2 teaspoons pure vanilla extract 2 cups packed fresh mint leaves 5 large egg yolks 1 cup crushed chocolate sandwich cookies (about 8 cookies)

1. In a medium saucepan, whisk together the

milk, cream, half of the white sugar, salt and vanilla. Place over medium heat and bring to a gentle simmer. Remove from heat and add the mint leaves; let steep for 20 to 30 minutes. If you desire a milder mint flavour, remove and discard the mint leaves after steeping, but for a more intense ice cream we recommend blending the milk/mint mixture using an immersion blender. After steeping, reheat the mixture to a gentle simmer over low heat.

2. While the milk/cream mixture is reheating,

combine the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or a whisk, beat until mixture is pale and thick.

3. Once the milk/cream mixture has come to a

gentle boil, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon, stir the mixture constantly over low heat until it thickens slightly and coats the back of the spoon. This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Pour the mixture through a fine mesh strainer

into a jug or bowl. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. When the ice cream is almost fully churned, gradually add the crushed cookies through the mix-in opening; let mix until fully combined.

6. The ice cream will have a soft, creamy

texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Mexican Style Chocolate Ice Cream This ice cream can be spicy for some, so adjust the cayenne to your personal taste. Makes about 5 cups (about ten ½-cup servings) 2 cups full cream milk 1½ cups thickened cream 2 teaspoons pure vanilla extract 1 teaspoon ground cinnamon 1 to 2 pinches ground cayenne pepper pinch flaked salt

R195 Mexican Style Chocolate Ice Cream

Reference formulation — not released for production. Source S127, PDF page 9 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

9 mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Fresh Mint with Chocolate Cookies Always a winning combination, fresh mint and chocolate take the forefront in this rich and creamy ice cream. Makes about 6 cups (twelve ½-cup servings) 2 cups full cream milk 2 cups thickened cream 1 cup white sugar, divided pinch flaked salt 2 teaspoons pure vanilla extract 2 cups packed fresh mint leaves 5 large egg yolks 1 cup crushed chocolate sandwich cookies (about 8 cookies)

1. In a medium saucepan, whisk together the

milk, cream, half of the white sugar, salt and vanilla. Place over medium heat and bring to a gentle simmer. Remove from heat and add the mint leaves; let steep for 20 to 30 minutes. If you desire a milder mint flavour, remove and discard the mint leaves after steeping, but for a more intense ice cream we recommend blending the milk/mint mixture using an immersion blender. After steeping, reheat the mixture to a gentle simmer over low heat.

2. While the milk/cream mixture is reheating,

combine the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or a whisk, beat until mixture is pale and thick.

3. Once the milk/cream mixture has come to a

gentle boil, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon, stir the mixture constantly over low heat until it thickens slightly and coats the back of the spoon. This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Pour the mixture through a fine mesh strainer

into a jug or bowl. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. When the ice cream is almost fully churned, gradually add the crushed cookies through the mix-in opening; let mix until fully combined.

6. The ice cream will have a soft, creamy

texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Mexican Style Chocolate Ice Cream This ice cream can be spicy for some, so adjust the cayenne to your personal taste. Makes about 5 cups (about ten ½-cup servings) 2 cups full cream milk 1½ cups thickened cream 2 teaspoons pure vanilla extract 1 teaspoon ground cinnamon 1 to 2 pinches ground cayenne pepper pinch flaked salt

Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

10 cup white sugar, divided 5 large egg yolks 180g bittersweet chocolate (70% cacao), roughly chopp ed

1. In a medium saucepan, whisk together the

milk, cream, vanilla, spices, salt and half of the sugar. Place over medium heat and bring to a gentle simmer.

2. While the milk/cream mixture is heating,

combine the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or a whisk, beat until mixture is pale and thick.

3. Place the chopped chocolate in a separate

mixing bowl; reserve. Once the milk/cream mixture has come to a gentle boil, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon, stir the mixture constantly over the low heat until it thickens slightly and coats the back of the spoon. This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Pour the mixture through a fine mesh strainer

into the bowl of the reserved chocolate; whisk to combine. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Grand Marnier Ice Cream A luxurious treat intended for the adult crowd. Makes about 5 cups (about ten ½-cup servings) 2 cups full cream milk 2 cups thickened cream Rind of one large orange 1 cup white sugar, divided pinch flaked salt 5 large egg yolks 1 teaspoon pure vanilla extract ¼ cup Grand Marnier (orange liquer)

1. In a medium saucepan, stir together the milk

and thickened cream. Place over medium heat and bring to a gentle simmer. Turn heat off and add the orange rind; let mixture steep for 30 to 60 minutes. After steeping, add half of the sugar and salt and gradually return the mixtureto a gentle boil over low heat.

2. While the milk /cream mixture is reheating,

combine the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or a whisk, beat until mixture is pale and thick.

3. Once the milk /cream mixture has come to a

gentle boil, whisk about ⅓ of the hot mixture into the yolk/sugar mixture. Add another ⅓ of the mixture, then return the combined mixture to the saucepan. Using a wooden spoon, stir the mixture constantly over the low heat until it thickens slightly and coats the back of the spoon. This mixture must NOT boil or the yolks will overcook – the process should only take a few minutes.

4. Stir in the vanilla and Grand Marnier and

pour the mixture through a fine mesh strainer (discard the orange zest); Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted

11 with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Dairy-Free Vanilla Ice Cream The soy milk powder helps the texture of the ice cream. If you are intolerant to soy then try an alternative listed below. Makes about 5 cups (ten ½-cup servings) 3 cups dairy-free milk (soy, almond, rice) 2 tablespoons soy milk powder ¾ cup white sugar pinch flaked salt 2 teaspoons pure vanilla extract

1. In a medium bowl, use a hand mixer on low

speed or whisk to combine the milk, sugar substitute and salt until the sugar substitute is dissolved. Cover, and refrigerate for a minimum of 2 hours or overnight. Whisk mixture again before pouring into the ice cream maker.

2. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The ice cream will have a soft texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Dairy-Free Vanilla Custard Ice Cream Another version of a dairy-free vanilla ice cream, but this version is a traditional cooked custard version, which makes it a bit creamier. If you are not allergic or intolerant to eggs, this is a great one to try. Makes about 5 cups (ten ½-cup servings) 3 cups dairy-free milk (soy, rice, almond, etc.) 1 cup white sugar pinch flaked salt 2 teaspoons pure vanilla extract 5 large egg yolks

1. In a medium saucepan stir together the milk,

half the sugar, salt and vanilla. Place over medium heat and bring to a gentle simmer.

2. While the milk mixture is heating, combine

the yolks and remaining sugar in a medium bowl. Using a hand mixer on low speed or whisk, beat until mixture is pale and thick.

3. Once the milk mixture has come to a slight

R202 Basic Vanilla Gelato

Reference formulation — not released for production. Source S127, PDF page 13 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

13 Basic Vanilla Gelato Drizzle in melted dark or milk chocolate for a decadent gelato. Makes about 5 cups (ten ½-cup servings) 1 cup thickened cream 3 cups full cream milk, divided 1 cup white sugar 2 tablespoons cornflour pinch flaked salt 2 teaspoon pure vanilla extract

1. In a medium saucepan, combine cream and 2

cups of the milk. Place over a medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, sugar, cornflour, salt and vanilla into a medium sized mixing bowl. Whisk to combine.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. With the saucepan still over medium heat, continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat, and transfer mixture

to a heatproof jug. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Note – Vanilla bean paste can be used as a substitute to extract and will result in the gelato having a black speckled, vanilla appearance. Use the same amount of paste, as you would extract. Chocolate-Hazelnut Gelato Makes about 5 cups (ten ½-cup servings) 1¾ cups thickened cream 2¼ cups full cream milk, divided ½ cup white sugar 2 tablespoons cornflour pinch flaked salt 1 cup chocolate-hazelnut spread, such as Nutella ® ½ cup chopped hazelnuts (or you may use the same amount of chopped Baci chocolates)

1. In a medium saucepan, combine cream and

1½ cups of the milk. Set over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, sugar, cornflour and salt into a small-medium mixing bowl. Whisk to combine.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. Slowly whisk in the chocolate- hazelnut spread. While still set over medium/ medium-low heat, continuously stir until mixture boils and thickens to where it can coat the back of a spoon (this will take about 10 to 15 minutes, depending on the stove being used).

4. Remove pan from heat, strain and cool to

room temperature. Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 30 minutes. About 5 minutes before the mixture has finished, add the chopped hazlenuts/candies through the GELATO

Original source recipe evidence

14 mix-in opening. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Custard Gelato This recipe uses egg yolks to create an extra creamy and custard-like flavour. Makes about 6 cups (twelve ½-cup servings) 1 cup thickened cream 2 cups full cream milk, divided 2 teaspoons pure vanilla extract ¼ teaspoon flaked salt 2 tablespoons cornflour 6 large egg yolks ¾ cup white sugar

1. In a medium saucepan, combine thickened

cream and 1¾ cups milk together with the vanilla and salt. Set over medium heat and bring to a gentle simmer. In a small bowl, mix together the remaining milk and cornflour and reserve.

2. While the cream mixture is heating, whisk the

egg yolks and sugar together really well until pale and thick (you can use a blender on low speed, or a hand blender, to be sure).

3. Once the cream/milk comes to a simmer, stir

in the milk/cornflour mixture well and continue to stir over low heat for an additional five minutes, being sure mixture does not come to a full boil.

4. Whisking continuously at the same time, very

slowly pour all of the hot liquid into the yolk/ sugar mixture. Return mixture back to the saucepan over low heat and whisk for about 5 minutes and then return to mixing bowl. (This mixture must NOT boil or the yolks will overcook). Cover the mixture with a layer of plastic wrap directly onto the surface to prevent a ‘skin’ forming as the mixture cools and stand at room temperature for 1 hour. Refrigerate for a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker

5. Pour the mixture into mixing bowl, fitted with

the gelato paddle, of the Cuisinart® Ice Cream and Gelato Maker. Turn unit on, set Timer and press Start. Let mix until thickened, about 30 to 40 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Espresso Gelato For an extra coffee hit, add some dark chocolate covered espresso beans toward the end of freezing. Makes about 4 cups (eight ½-cup servings) 1 cup thickened cream 2 cups full cream milk, divided 120ml double shot of espresso coffee 1 cup white sugar 2 tablespoons cornflour pinch flaked salt

1. In a medium saucepan, combine cream and

1½ cups of the milk. Place over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, espresso, sugar, cornflour and salt into a medium mixing bowl. Whisk to combine.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. With the saucepan still over medium heat, continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat, and transfer mixture

to a heatproof jug. Cover, and refrigerate a minimum of 2 hours or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

15 with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Lemon Gelato The perfect amount of sweet and tart for this classic gelato flavour. Makes about 4 cups (eight ½-cup servings) 1 cup thickened cream 2 cups full cream milk, divided 4 lemons, rind removed (reserve 2 tablespoons of finely grated lemon rind), juiced with juice reserved 1¼ cup white sugar 1 teaspoon pure vanilla extract 2 tablespoons cornflour

1. In a medium saucepan, combine cream and 1

cup of the milk. Place over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, lemon rind, sugar, cornflour, salt and vanilla into a medium sized mixing bowl. Whisk to combine.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. With the saucepan still over medium heat, continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat, and transfer mixture

to a jug or bowl and stir in the lemon juice. Cover and refrigerate for a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl, fitted

with the gelato paddle, of the Cuisinart® Ice Cream Maker. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Mascarpone and Fig Gelato Mascarpone and fig combine deliciously together in this grown up gelato flavour. Makes about 6 cups (twelve ½-cup servings) Fig purée: 1 cup dried, figs, about 12 figs 1½ cups water 2 tablespoons honey Mascarpone base: 1 cup thickened cream 2 cups full cream milk, divided 1¼ cups white sugar 1 teaspoon pure vanilla extract 2 tablespoons cornflour 300g mascarpone 1 generous cup fig purée (entire yield from recipe above) Make the purée:

1. Put the figs, water and honey in a small

saucepan. Bring mixture to a boil and then immediately reduce the heat to maintain a gentle simmer.

2. Continue simmering for for a minimum of 3

hours, adding water as necessary to keep the figs covered while they are simmering.

3. When figs are really soft and there is only ½

cup of liquid remaining, purée mixture with a hand blender until smooth. Refrigerate until ready to use. While the figs are simmering, prepare the base:

1. In a medium saucepan, combine the cream

and 1 cup of the milk. Place over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, sugar, cornflour, salt and vanilla into a medium mixing bowl. Whisk to combine.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined,

4. With the saucepan still over medium heat,

continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

5. Remove pan from heat. Place the

mascarpone into a bowl and soften with a spoon. Slowly pour the hot liquid into the mascarpone, mixing with a hand mixer or whisk until mixture is completely homogenous and smooth. Cover and refrigerate a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker, base will be very thick.

6. Pour the mixture into the mixing bowl, fitted

with the gelato paddle, of the Cuisinart® Ice Cream and Gelato Maker. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. Once the gelato is thick, spoon the fig mixture in while mixing, a large dollop at a time until all is incorporated. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Mixed Berry Gelato Makes about 5 cups (ten ½-cup servings) 1 cup thickened cream 2 cups full cream milk, divided 1 cup white sugar 2 tablespoons cornflour pinch flaked salt 1 cup mixed fresh or frozen (thawed) berries ½ teaspoon pure vanilla extract 1 tablespoon mixed berry jam

1. In a medium saucepan, combine cream and

1½ cups of the milk. Set over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, sugar, cornflour and salt into a medium mixing bowl. Whisk to combine. Using a blender, food processor or hand blender, purée the berries until mostly smooth; reserve.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. While still set over medium/ medium-low heat, continuously stir until mixture boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat, stir in the puréed

berries, vanilla and jam; using a wire meshed sieve strain mix into a jug or bowl. Cover and stand at room temperature for 1 hour. Refrigerate a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 30 to 40 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer to

an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving.

R209 Olive Oil-Thyme Gelato

Original source recipe evidence

17 Olive Oil-Thyme Gelato Makes about 4½ cups (nine ½-cup servings) 1 cup thickened cream 3 cups full cream milk, divided 1 large sprig fresh thyme leaves 1 cup white sugar 2 tablespoons cornflour pinch flaked salt ½ cup extra virgin olive oil

1. In a medium saucepan, combine cream, 2

cups of the milk, and the thyme. Place over medium heat and bring to a gentle simmer. Remove from heat and allow thyme to steep in the cream/milk mixture for about 30 minutes. After steeping, remove and discard thyme and then return to the heat and bring back to a simmer.

2. While cream/milk mixture is re-heating, put

the remaining milk, sugar, cornflour and salt into a small-medium mixing bowl. Whisk to combine. Slowly whisk in the olive oil.

3. Once milk/cream mixture comes to its

second simmer, add the milk/sugar mixture and stir until fully combined. With the saucepan still over medium heat, continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat, and transfer mixture

to a jug or bowl. Cover and stand at room temperature for 1 hour. Refrigerate a minimum of 2 hours, or overnight.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the gelato paddle of the Cuisinart® Ice Cream Maker. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. If a firmer consistency is desired, transfer the ice cream to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Pistachio Gelato Makes about 4 cups (eight ½-cup servings) 1 cup thickened cream 3 cups full cream milk, divided 1¼ cups white sugar, divided 2 tablespoons cornflour pinch flaked salt 2 cups pistachios kernels ¾ teaspoon pure almond extract

1. In a medium saucepan, combine cream and 2

cups of the milk. Place over medium heat and bring to a gentle simmer.

2. While cream/milk mixture is heating, put the

remaining milk, 1 cup of the sugar, cornflour and salt into a medium mixing bowl. Whisk to combine; reserve. Put the pistachios and remaining ¼ cup of sugar into a food processor. Pulse to roughly chop; reserve.

3. Once milk/cream mixture comes to a simmer,

add the milk/sugar mixture and stir until fully combined. With the saucepan still over medium heat, continuously stir mixture until it gently boils and thickens to where it can coat the back of a spoon (this will take about 15 minutes, depending on the stove being used).

4. Remove pan from heat and transfer mixture

to a heatproof jug, stir in almond extract and pistachio/sugar mixture. Cover and stand at room temperature for 1 hour. Refrigerate a minimum of 2 hours, or overnight. Whisk mixture together again before pouring into the ice cream maker.

5. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 50 minutes. The gelato will have a soft, creamy texture. Original source recipe evidence

18 Honey-Almond Frozen Yoghurt Makes about 5 cups (ten ½-cup servings) 2 cups thickened cream ¼ cup honey ¼ cup white sugar pinch flaked salt 2 cups full cream milk vanilla yoghurt 1½ teaspoons pure almond extract ½ cup toasted sliced almonds

1. In a medium saucepan, combine the cream,

honey, sugar and salt. Place over medium heat and bring to a gentle simmer. Cover and stand at room temperature for 1 hour.

2. In a medium mixing bowl, whisk the yoghurt

and almond extract together until combined. Re-cover and refrigerate a minimum of 2 hours, or overnight. Whisk mixture again before pouring into the ice cream maker.

3. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. About 5 minutes before the mixture is done churning, add the sliced almonds through the mix-in opening. Allow to mix thoroughly. The frozen yoghurt will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Pumpkin Frozen Yoghurt Getting tired of the same old pumpkin desserts? Serve this to your guests with some fresh ginger bread and whipped cream. Makes about 5 cups (ten ½-cup servings) 1 cup thickened cream 450g pumpkin purée (pre steamed and pureed) 1⅓ cups packed light brown sugar 1½ teaspoons ground cinnamon 1 teaspoon ground ginger ¼ teaspoon ground nutmeg pinch flaked salt 2 cups plain, full fat yoghurt (you can substitute vanilla yoghurt, but then reduce the vanilla extract to 1 teaspoon) 1½ teaspoons pure vanilla extract

1. In a medium saucepan, combine all

ingredients, except for the yoghurt and vanilla. Place over medium heat and bring to a gentle simmer, whisking occasionally to combine ingredients. Cover and stand at room temperature for 1 hour.

2. In a medium mixing bowl, whisk the yoghurt

and vanilla together until combined. Slowly whisk in the cooled cream/pumpkin mixture and continue to whisk until combined. Re-cover and refrigerate a minimum of 2 hours, or overnight. Whisk mixture again before pouring into the ice cream maker.

3. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 40 minutes. The frozen yoghurt will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. Original source recipe evidence

19 Coconut Sorbet Delicious when topped with toasted coconut or our Hot Fudge Sauce (page 18). Makes about 5 cups (ten ½-cup servings) 1¼ cups water 1¼ cups white sugar 1 whole vanilla bean, halved and seeds scraped pinch flaked salt 2 cans (400ml) unsweetened coconut milk

1. Combine the water, sugar, vanilla bean

(including the pod) and salt. Place over medium heat and bring to a gentle simmer. Remove saucepan from heat and allow the mixture to stand/steep for 1 hour; using a fine wire meshed strainer, strain the mixture (discarding pod) into a jug or bowl.

2. Add the coconut milk to the strained mixture.

Cover and refrigerate for a minimum of 2 hours, or overnight. Whisk mixture again before pouring into the ice cream maker.

3. Pour the mixture into the mixing bowl of the

Cuisinart® Ice Cream and Gelato Maker fitted with the ice cream paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 60 minutes. The sorbet will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. Prosecco-Grapefruit Sorbet Makes about 4 cups (eight ½-cup servings) ¾ cup water ¾ cup white sugar 1 tablespoon finely grated grapefruit rind 2 cups fresh grapefruit juice ¾ cup prosecco (Italian sparkling wine)

1. In a medium saucepan combine the water,

sugar, grapefruit rind and salt. Place over medium heat and heat until the sugar is dissolved.

2. Pour the grapefruit juice into the sugar

mixture and whisk together. Cover and refrigerate for a minimum of 2 hours, or overnight. Using a fine wire meshed strainer, strain the mixture and then whisk in prosecco prior to pouring into the ice cream maker.

3. Pour the mixture into the ice cream mixing

bowl, fitted with the gelato paddle. Turn unit on, set Timer and press Start. Let mix until thickened, about 60 minutes. The sorbet will have a soft, creamy texture. If a firmer consistency is desired, transfer to an airtight container and place in freezer for about 2 hours. If frozen for longer remove from freezer about 10 minutes before serving. SORBETS

R215 Caramel Sauce

Reference formulation — not released for production. Source S127, PDF page 20 (shared page may contain adjacent recipe).

Review decision: Domestic batch-freezer recipe; preserve its own cup convention, cream type and paddle method. Weigh the formulation and qualify commercial processing. Adjacent recipes may share this reference page; ingredient association must be checked before adoption. No diabetic, dairy-free or other health claim is adopted.

Original source recipe evidence

20 Caramel Sauce While we love this sauce on our ice creams, it can also be used as a dipping sauce for fruit and cake. Makes about ¾ cup ¾ cup white sugar ¼ teaspoon flaked salt ¼ cup water (enough so that the consistency when mixed with the sugar and salt is similar to wet sand) 1 tablespoon light glucose syrup ⅓ cup thickened cream 60g unsalted butter, cut into 1cm cubes

1. In a medium, heavy-based saucepan, stir

together the sugar, salt, water and glucose syrup. Be sure to clean the inside walls of the pan if there is any sugar on the sides (a clean, wet pastry brush works best). Set over medium-low heat, to keep the mixture at a low simmer, and cook until the sugar mixture turns a very light amber colour (about 15 to 20 minutes). Keep a close eye on the caramel sauce as it can burn easily.

2. Once the sugar mixture has a light amber

colour, take it off the stove and slowly and carefully stir in the cream. After the cream has been incorporated, slowly whisk in the butter, one piece at a time, continually whisking to emulsify until all the butter has been added. Use immediately, or keep warm over a pot of warm water. Caramel can also be cooled and reheated for future use. Note – salted caramel is very popular. The salt amount can be increased to taste. Hot Fudge Sauce Makes about 2 cups ⅔ cup thickened cream ⅓ cup light glucose syrup ⅓ cup packed light brown sugar ¼ cup cocoa powder, sifted ¼ teaspoon flaked salt 40g unsalted butter 1 teaspoon pure vanilla extract 30g semisweet chocolate

1. In a heavy-based saucepan, combine all

ingredients except for the chocolate. Place over medium heat and bring to a gentle simmer. Add chocolate and whisk to combine. SAUCES

R217 RECIPE MANUAL

Reference page — normalization and release unresolved. Source S126, PDF page 1.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

RECIPE MANUAL Ice Cream

Ice cream mixtures can be as simple as pureed fruit, sugar and cream, Philadelphia-style, or based on more complicated cooked custards, French- style. Both are delicious, though French versions are slightly richer. The recipes which follow are for both kinds. All use rich, heavy cream. If you prefer a lighter, lower-calorie dessert, substitute milk (whole or skim) or even yogurt for the cream in any of these recipes. Sample the mixtures before freezing and adjust to personal taste.

Use these recipes as an inspiration for your own favorite ice creams. If you like a little crunch, add a cup of chopped nuts, chocolate chips or candy to a quart of mixture either before or after freezing, depending on whether you want the crunch to be frozen, too. You can also add chopped fruit, fresh or dried, shredded coconut, even marshmallows. It’s better to add these soft things at the end so they don’t get icy.

Banana Ice Cream

Riper bananas provide a sweeter flavor.

4 ripe bananas 3 tablespoons fresh lemon juice ¾ cup simple syrup 1 cup heavy cream

Working quickly to keep the bananas from darkening, peel and place them in a food processor with the lemon juice. Purée until smooth. You should have about 2 cups of purée. Stir in the simple syrup, then the cream. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

June 15, 1951 was declared National Ice Cream Day by Congress in recognition of the fact that the ice cream industry was then 100 years old.

Strawberry Ice Cream

Original source recipe evidence

2 pints strawberries, washed and bulled ½ cup plus 2 tablespoons superfine sugar 3 tablespoons fresh lemon juice 1 ½ cups heavy cream

Purée strawberries in a food processor. Stir in the remaining ingredients. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Maple Walnut Ice Cream

2 cups heavy cream ¾ cup milk 1 ¼ cups Vermont grade A maple syrup ¾ cup walnut pieces

Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual. _____ George Washington was inordinately fond of ice cream. According to the books of an early ice cream seller, the father of our country spent $200 on ice cream just during the summer of 1790.

Peach Ice Cream When fresh peaches are out of season, this simple desert will conjure up memories of warmer days.

Two 16-ounce cans of peaches packed in heavy syrup, drained, liquid discarded. ¾ cup simple syrup 3 tablespoons fresh lemon juice 1 cup heavy cream

Puree the peaches in a food processor. Add the syrup, lemon juice and cream. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

R219 Apricot Ice Cream

Reference page — normalization and release unresolved. Source S126, PDF page 3.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

Apricot Ice Cream

Substitute apricots for the peaches. Use only 2 tablespoons lemon juice.

According to Godey’s Lady’s Book in 1850, “A party without ice cream would be like a breakfast without bread or a dinner without a roast”.

Quick Raspberry Ice Cream

Two 10-ounce partially thawed raspberries packed in syrup, partially thawed. 2 cups heavy cream

Lightly crush the raspberries while still in the bag. Pour into the bowl of the machine and add the cream. Freeze.

Coconut Ice Cream

One 15-ounce can sweetened cream of coconut. 1 cup milk 1 ½ cups heavy cream ½ cup tightly-packed sweetened coconut flakes

Place the coconut cream and milk into a food processor and blend thoroughly. Stir in the cream and coconut flakes. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Avocado Ice Cream

While an avocado-flavored dessert may seem strange to North Americans, South Americans have long considered the avocado an ideal ingredient for sweet desserts. Try this recipe and you’ll understand why.

Four 8-ounce avocados ¾ teaspoon salt 1 cup superfine sugar 6 tablespoons fresh lemon juice

R220 Pour the mixture into the bowl of the ice cream maker and freeze. Please follow

Reference page — normalization and release unresolved. Source S126, PDF page 4.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

1 cup heavy cream

Peel and pit the avocados. Cut them into chunks and puree in a food processor. You should have about 3 cups of puree. With the machine running, add the remaining ingredients. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Custard Ice Cream Base

This base will keep for 3 to 4 days the refrigerator in a tightly covered container. Please note that it is important that the container be well sealed or the base will absorb flavors from other foods. If you prefer to use turbinado sugar, substitute it for the granulated in this recipe.

3 cups heavy cream 1 cup whole milk ¾ cup sugar 4 egg yolks

Heat the cream, milk and sugar in a heavy-bottomed saucepan, stirring occasionally until the sugar is dissolved and the mixture is hot. Place the egg yolks in a bowl and whisk briefly. Still whisking, slowly pour the eggs to combine with the mixture in the saucepan. Cook over medium heat, stirring constantly, until the mixture thickens slightly and coats the back of a spoon, about 8 minutes. Be sure not to let the mixture boil to avoid curdling. Strain the mixture into a clean bowl and use as directed in the specific recipes.

There isn’t enough pure vanilla in the world to satisfy America’s craving for vanilla ice cream, which explains why most vanilla ice cream is artificially flavored. Vanilla is far and away the most popular ice cream flavor in the country. _____ Chocolate is the second most popular ice cream flavor but vanilla sales outnumber chocolate by over three to one.

R221 Rich Vanilla Ice Cream

Reference page — normalization and release unresolved. Source S126, PDF page 5.

Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

Rich Vanilla Ice Cream

This rich Vanilla ice cream is better than anything you can find commercially--- even in an ice cream parlor.

3 cups heavy cream 1 cup whole milk ¾ cup sugar 2 vanilla beans, split, or 2 tablespoons vanilla extract 4 egg yolks

Follow the recipe for the Custard Ice Cream Base, adding the vanilla beans to the saucepan with the cream, milk and sugar. Just before straining, scrape the seeds from the beans into the custard base. If using vanilla extract, add to the base after straining. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Honey Vanilla Ice Cream

Follow the recipe for Rich Vanilla Ice Cream, substituting ½ cup honey for the sugar.

Chocolate Ice Cream

3 ounces semisweet chocolate 1 ounce unsweetened chocolate 1 recipe Custard Ice Cream Base, warm

Melt the chocolate together in a saucepan over low heat, stirring occasionally until smooth. Gradually add some of the ice cream base to the chocolate, whisking it frequently to keep the chocolate smooth. Add the remaining ice cream base and cook over low heat until the mixture is well blended. Cool thoroughly. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

R222 Coffee Ice Cream

Original source recipe evidence

Coffee Ice Cream

We like this garnished with candy coffee beans.

1 recipe Custard Ice Cream Base ¼ cup instant coffee granules, preferably espresso

Mix about 1 cup of the Custard Ice Cream Base together with the coffee. Stir over low heat until the coffee is dissolved. Mix with the remaining base. Cool thoroughly. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Pistachio Ice Cream

1 recipe Custard Ice Cream Base, chilled 1 cup shelled, blanched, peeled, coarsely chopped pistachio nuts ½ teaspoon almond extract

Mix all the ingredients together. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Cinnamon Ice Cream

Try this with hot apple pie.

1 recipe Custard Ice Cream Base ¾ teaspoon ground cinnamon or 2 cinnamon sticks

Put about 2 cups of the Custard Ice Cream Base with the cinnamon into a saucepan. Cook over low heat, stirring constantly, 5 to 10 minutes, or until the mixture is warm and suffused with cinnamon flavor. Cool thoroughly. Remove cinnamon sticks, if used. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

R223 Peach Pit Ice Cream

Reference page — normalization and release unresolved. Source S126, PDF page 7.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

Peach Pit Ice Cream

This same technique will work with other pitted fruits. Fresh cherries are particularly good. Puree the fruit in a food mill so the pits and skins are easily separated from the pulp.

1 ¼ pounds (about 8 medium) peaches ¼ cup fresh lemon juice 1 ½ cups heavy cream 1 ½ cups milk ¾ cup sugar 3 egg yolks

Peel and pit the peaches, reserving the peel and pits. Puree the pulp with the lemon juice. You should have 2 cups of puree. Refrigerate. Place the reserved peels and pits in a saucepan with the cream and milk. Simmer covered over low hear for 20 minutes. Do not boil. The mixture may look slightly separated due to the acid in the fruit. Add the sugar and stir to dissolve. Place the egg yolks in a bowl and whisk briefly. Still whisking, slowly pour in about 1 cup of the liquid. When the mixture is blended, slowly pour it into liquid in the saucepan, whisking constantly. Cook over medium heat, stirring constantly, until the mixture thickens slightly and coats the back of the spoon, about 8 minute. Be sure not to let the mixture boil at any time or it will curdle. Strain the mixture into a clean bowl and cool thoroughly. Combine the custard mixture with the peach puree. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Oreo Ice Cream

A childhood fantasy adult’s love.

1 recipe Chocolate Ice Cream or Rich Vanilla Ice Cream, chilled but not frozen. 1 cup broken Oreo cookies (8 to 10)

Pour the chocolate or vanilla ice cream mixture into the bowl of the machine and freeze 10 minutes, add the Oreos. Continue to freeze.

R224 Brown Sugar Pecan Ice Cream

Reference page — normalization and release unresolved. Source S126, PDF page 8.

Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

shaped balls. Arrange three scoops (different flavors and colors if you have them) on the plate and garnish with a few pieces of fruit, sprigs of mint or candied violets.

Simple Syrup

This is an exceedingly useful mixture to have on band in the refrigerator. Appropriately named, it is simply a mixture of sugar and water cooked enough to dissolve the sugar and make very light syrup. This guarantees that you'll never have the graininess founding imperfectly dissolved sugar mixtures. Since your goal is a frozen dessert, it will freeze faster if all the ingredients are cold--- or at least room temperature--- to begin with. So, while making the simple syrup takes only a few minutes, waiting for it to cool, takes much longer. Making it ahead is a true timesaver. Simple syrup has a practically endless life since there is nothing to spoil. You can make a batch of any quantity, forget about it for months (although fresh sorbets are so good you won't want to) and still be sure it's good.

4 cups sugar 4 cups water

Place the water and sugar in a saucepan and simmer until the sugar is dissolved. Cool to room temperature, then refrigerate in a covered container.

Fresh Strawberry Sorbet

You might make extra puree and use it as a sauce under the sorbet. Also a fresh mint spring makes a pretty garnish.

2 pints strawberries, washed and hulled 1 cup plus 2 tablespoons simple syrup ¼ cup fresh lemon juice

Purée the strawberries in a food processor. You should have about 3 cups. Stir 1 cup of simple syrup and the lemon juice. Taste and add remaining syrup if necessary. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer's instructional manual.

R226 About 1660, it is said, a Sicilian named Francisco Procopio introduced ice cream

Original source recipe evidence

About 1660, it is said, a Sicilian named Francisco Procopio introduced ice cream and water ices to France.

Cantaloupe Sorbet

Any ripe melon may be substituted for the cantaloupe. Always taste the mixture before freezing and adjust the simple syrup and lemon juice as needed

1 large cantaloupe 1 ¼ cups simple syrup 1 tablespoon fresh lemon juice

Peel and seed the cantaloupe. Cube the flesh and puree in a food processor. You should have about 3 ½ cups of puree. Stir in the simple syrup and lemon juice. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Melon and Prosciutto Sorbet

Follow the recipe for Cantaloupe Sorbet, stirring in 3 tablespoons finely chopped prosciutto after the mixture has frozen for 10 minutes.

Kiwi Sorbet

The beautiful green color complements the rosy hue of a strawberry sorbet, pleasing both the eye and the palate

8 kiwi fruits 1 1/3 cups simple syrup 4 teaspoons fresh lemon juice

Peel the Kiwis. Purée in a food processor. You should have about 2 cups of purée. Stir in the simple syrup and lemon juice. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

R227 By 1676 there were 250 official limonadiers, sellers of ice creams and water ices,

Original source recipe evidence

it is complicated to make, the resulting sorbet is truly special. The same procedure will work with other fruit puree.

6 tablespoons water ¾ cup sugar 3 egg whites 3 cups strawberries, washed, hulled and pureed 1 ½ tablespoons fresh lemon juice

Combine the water and sugar in a small saucepan. Dissolve the sugar over medium heat, and then continue cooking until the mixture boils and becomes clear. Use a wet brush to wash down the sides of the pot to dissolve any sugar crystals. Continue to boil the mixture until it reached the soft ball stage, 238°F. If you don’t have a thermometer, test by putting a drop of syrup in cold water. When the drop forms a solid but soft ball, the syrup is ready. While you are making the syrup, place the egg whites in a clean metal bowl. Beat until they just begin to foam. Then slowly pour in the hot sugar syrup. Take a full minute to add the syrup. Continue beating for about 10 minutes, or until the bottom of the bowl feels cool to the touch. Gently fold in the strawberry puree and lemon juice. It is not necessary to blend thoroughly. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Iced foods have a long history going back to Alexander the Great, who kept trenches full of snow during the siege of Petra for a cool refreshment.

Sugarless Apple Sorbet

3 cups unsweetened apple juice One 6-ounce can unsweetened concentrated apple juice 3 tablespoons fresh lemon juice

Place the apple juice concentrate and lemon juice in the bowl of the machine and freeze.

Original source recipe evidence

Cranberry Juice Sorbet

The tart cranberry flavor makes this part particularly refreshing.

3 cups plus 6 tablespoons canned or bottled cranberry juice ½ cup plus 1 tablespoon simple syrup

Mix the cranberry juice and simple syrup together. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Orange Sorbet

Very quick and refreshing. If you like tart foods and want an even easier treat, just use the orange juice.

1 quart orange juice ¼ cup superfine sugar 1 tablespoon fresh lemon juice

Put the orange juice, sugar and lemon juice in the bowl of the machine and freeze.

Grapefruit juice Sorbet

Try serving this instead of chilled juice at your next brunch.

2 2/3 cups unsweetened grapefruit juice 1 1/3 cups simple syrup

Mix the grapefruit juice and simple syrup together. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Grape Juice Sorbet

Substitute unsweetened grape juice for the grapefruit juice.
_____ In January 1974 Craig Claiborne of the New York Times described what he would

Original source recipe evidence

have for his mythical “last meal”. It began with fresh caviar and ended with grapefruit sherbet.

Lemon Sorbet

The perfect ending to a heavy meal.

1 ½ cups fresh lemon juice 1 tablespoon grated lemon zest 3 cups simple syrup

Place the lemon juice, zest and simple syrup in the bowl of the machine and freeze.

Honey Lemon Sorbet

½ cup hot water 2/3 cup honey 1 tablespoon grated lemon zest 1 cup fresh lemon juice 2 cups cold water

Place the hot water, honey and zest in the bowl. Stir until honey dissolves. Stir in the lemon juice and cold water. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

During the first century, Emperor Nero sent runners to the mountains for snow which was then flavored with honey, juices and fruit pulps.

When Marco Polo returned from the Far East in the late 1200s, he had a recipe for a frozen dessert which included milk in the ingredients, seeming to resemble a modem sherbet.

Chocolate Sorbet

Wonderfully chocolaty --- smooth and dense.

R233 Heat the water and sugar together in a saucepan. Add the chocolate and simmer

Original source recipe evidence

Chicken Soup and Dill Sorbet

This is just the thing to start a dinner on a hot summer’s eve.

1 quart rich homemade chicken stock 2 tablespoons tightly packed, finely chopped fresh dill 2 to 4 tablespoons fresh lemon juice Salt and freshly ground pepper to taste

Please all the ingredients into the bowl of the machine and freeze.

Gazpacho Sorbet

2 ½ cups chilled Gazpacho (see Gazpacho recipe) 2 tablespoons fresh lemon juice 1 teaspoon salt 1 cup water 1 cup tomato juice ¼ teaspoon Tabasco 4 grindings fresh black pepper

Mix all the ingredients together, adjusting the seasonings to taste. Strain the mixture and reserve the vegetable chunks. Pour the liquid into the bowl of the machine and after freezing 10 minutes, stir in the reserved vegetable and freeze until firm.

Gazpacho

½ medium Bermuda or other sweet white onion, peeled and quartered 1 ½ firm, medium cucumbers, peeled and cut into chunks 2 small green peppers, seeded and cut into eights 6 medium to large ripe tomatoes, peeled and cut into eights 5 large garlic cloves 1 cup tomato juice, approximately ½ cup light olive oil ¾ teaspoon chili powder or 1 small piece fresh chili pepper 1 tablespoon salt

R235 Borscht Sorbet

Reference page — normalization and release unresolved. Source S126, PDF page 20.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Original source recipe evidence

Add the onion to the work bowl of a food process fitted with the metal blade. Process, turning on and off, rapidly, until finely chopped, about 4 or 5 seconds. Transfer the onion to a large bowl. Repeat with the cucumbers, then with green peppers, adding each to the onions in the bowl. Process 5 of the tomatoes until evenly chopped into small pieces. Transfer to the bowl with other chopped ingredients. Process the remaining tomato with the garlic, tomato juice, olive oil and chili powder until a smooth liquid is formed. Combine with the chopped vegetables and slat and chili in a covered container.

Borscht Sorbet

1 pound beets 5 cup water 2 ½ teaspoons white vinegar 2 tablespoons fresh lemon juice ¾ teaspoon citric acid (sour salt) crystals ½ to ¾ cup sugar 2 ¼ teaspoon salts Sour cream Chopped dill

Wash and scrub the beets well. Trim off all but 1 inch of the stems. Put the beets in a pot with the water. Place over high heat and bring to a boil. Cover the pan, reduce the heat to a low boil and cook 20 to 40 minutes, or until the beets can be pieced with a skewer. (Cooking time depends on the size and age of the beets.) Set aside to cool slightly. Strain the beets through a fine mesh strainer into a pan. Reserve the beets for another use. Measure the liquid and add enough water to make 4 cups. While the liquid is still hot, add the vinegar, lemon juice, citric acid, sugar and salt. Stir to dissolve. Taste and correct seasoning if necessary. The effect should be sweet and sour. Cool the borscht thoroughly. Pour into the bowl of the machine and freeze. Garnish with a dollop of sour cream and a sprinkling of fresh dill.

Red Bean Paste Sorbet

This unusual sorbet could be the perfect way to end a Chinese dinner.

R236 Pour the mixture into the bowl of the ice cream maker and freeze. Please follow

Reference page — normalization and release unresolved. Source S126, PDF page 21.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Original source recipe evidence

machine and freeze 12 to 15 minutes. Makes about 1 quart.

Champagne Sorbet

Alcohol sorbets defrost quickly, so leave this in the machine until moments before serving. Serve as part of a long dinner or for dessert with fresh strawberries.

1 bottle (about 3 cups) chilled Champagne 1 ½ cups simple syrup

Pour the Champagne and simple syrup into the bowl of the machine and freeze 30 minutes. Makes 5 cups

Calvados Sorbet

Traditional formal French dinners include a non-sweet sorbet in the middle of the meal as a palate cleaner. We find they can be a fun course even for simple dinners, especially in the summer. Very small portions are all that are needed. One cup will serve 6 to 8 dinners

1 ¾ cups plus 2 tablespoons Calvados 3 tablespoons simple syrup

Heat 1 ½ cups Calvados in a saucepan over medium heat until warm. Turn off the heat, stand back and touch a lit match to the Calvados. Let it flame until the flames die down, about 8 minutes. Stir in the remaining 6 tablespoons unflamed Calvados and the simple syrup. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual. 30 minutes.

Sherbets

Sherbets are ices, usually fruit-flavored, similar to sorbets (sometimes the words are used interchangeably) but sherbets usually have more ingredients, such as milk, egg whites or gelatin. We’ve made our milk sherbets with the dieter in mind, using

R238 skim and non-fat dry milk instead of whole milk. The fruit recipes can be varied in

Reference page — normalization and release unresolved. Source S126, PDF page 23.

Review decision: Source page may contain several variants or continued recipes; retain all listed quantities and see the adjoining original page for context. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

skim and non-fat dry milk instead of whole milk. The fruit recipes can be varied in infinite ways by changing the fruits used. Consider peaches, pears or apricots. Our fruit sorbets can be turned into sherbets if you add a beaten egg white to the mixture after it is partially frozen.

Vanilla Ice Milk

This is a basic recipe. You may add other flavorings, fruit purees or nuts according to taste.

3 cups skim milk ½ cup sugar 6 tablespoons non-fat dry milk 1 ½ teaspoons vanilla extract

Heat the milk, sugar and non-fat dry milk in a saucepan, stirring until the sugar and dry milk are dissolved. Cool thoroughly. Stir in the vanilla. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Chocolate Ice Milk

This delicious treat is much lower in calories than a traditional chocolate ice cream.

1 quart milk 1 ¼ cups sugar 4 ounces unsweetened chocolate

Heat the milk and sugar together in a saucepan, in another saucepan; melt the chocolate slowly over low heat. When smooth, gradually add the milk-sugar mixture to the chocolate, stirring constantly to keep the chocolate smooth. Cook over medium heat until the mixture is smooth. Cool thoroughly. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Strawberry Milk Sherbet

Original source recipe evidence

2 cups skim milk 1/3 cup sugar 6 tablespoons non-fat dry milk 1 ½ teaspoons vanilla extract 1 pint strawberries, washed, hulled and coarsely chopped 1 tablespoon fresh lemon juice

Heat the milk, sugar and non-fat dry milk in a saucepan, stirring until the sugar and dry milk are dissolved. Cool thoroughly. Stir in the strawberries, lemon juice and vanilla. Pour the mixture into the bowl of the ice cream maker and freeze. Please follow the manufacturer’s instructional manual.

Frozen Yogurt

Yogurt can replace the cream in ice cream, giving a smooth and creamy – although not as rich – result. Once you’ve made your own frozen yogurt, even using commercially-flavored yogurt, you’ll never go back to the store-bought variety. As with the ice creams, you can add myriad chunked flavorings to frozen yogurts, including chopped fruits or nuts or a healthy sprinkling of wheat germ.

Fresh frozen Strawberry Yogurt

2 pints strawberries, washed and hulled 2 cups unflavored yogurt 1/3 cup honey

Purée the strawberries in a food processor. Put the yogurt, honey and strawberry puree into the bowl of the machine and freeze.

Frozen Strawberry Yogurt

4 cups commercial strawberry yogurt

Place the yogurt in the bowl of the machine and freeze

Original source recipe evidence

sauce.

Raspberry Sauce

Two 10-ounce packages frozen raspberries packed in syrup, deforested juice of ½ lemon.

Place the raspberries in the work bowl of a food processor fitted with the steel blade. Add the lemon juice and process until smooth. Press through a strainer to remove the seeds Makes about 2 cups.

Note: This sauce can be made with other fresh or frozen fruits. If using fresh fruit, add sugar to taste.

Butterscotch Sauce

Beautifully rich and creamy.

1 1/3 cups firmly packed dark brown sugar ½ cup light corn syrup 4 tablespoons unsalted butter ¼ teaspoon salt 2 tablespoons water 2 teaspoons vanilla extract 1/3 cup heavy cream

Mix the brown sugar, syrup, butter, salt and water in a saucepan and bring to full boil. Immediately remove from the heat, stir in the vanilla, and then slowly pour in the cream. Serve warm or cooled. Makes about 2 ½ cups.

Caramel Sauce

A wonderfully gooey sauce.

1 ¼ cups sugar

R242 Place the sugar in a heavy saucepan over medium heat and stir continuously until

Reference page — normalization and release unresolved. Source S126, PDF page 27.

Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

½ cup corn syrup Pinch of salt 1/3 cup plus 1 tablespoon heavy cream

Place the sugar in a heavy saucepan over medium heat and stir continuously until the sugar becomes liquid. Crush any lumps against the side of the pan. Cook only until the sugar is golden brown. If there are persistent lumps, remove the pan from the heat and continue to stir vigorously until the lumps dissolve. Return to the heat and slowly pour in the corn syrup, stirring rapidly. Add the salt and slowly pour in the heavy cream. Serve warm. Makes about 2 ½ cups.

Hot Fudge Sauce

Guaranteed to make a lush hot fudge sundae.

½ cup heavy cream 3 tablespoons unsalted butter 1/3 cup sugar 1/3 cup firmly packed dark brown sugar 1/8 teaspoon salt ½ cup unsweetened cocoa, sifted

Combine the cream and butter in a saucepan. Stir over medium heat until the butter melts and the cream just begins to boil. Add the sugars. Gently heat and stir until the sugars are completely dissolved. Add the salt and cocoa, whisking cautiously over low heat until smooth. If there are any remaining bits of cocoa, press them against the side of the pan with a spoon or spatula until they dissolve then stir them into the sauce. Serve immediately Makes about 2 cups.

Note: This sauce keeps well in the refrigerator, but it may thicken when chilled. Reheat very slowly in a double boiler, adding hot water a few drops at a time, if necessary.

R243 Myths abound about the origin of the ice cream sundae. In all stories the spelling

Reference page — normalization and release unresolved. Source S126, PDF page 28.

Vague household measures, product specifications and commercial process/yield remain unresolved. Do not use peach/apricot pits or bitter kernels for flavour extraction. Raw-egg and raw-fruit cold mixtures need a qualified safe process; frozen savoury stock is a perishable food.

Original source recipe evidence

Myths abound about the origin of the ice cream sundae. In all stories the spelling is a variant on Sunday. Essentially an ice cream soda without the soda, it was said to appeal to Sabbath observers who wouldn’t drink soda on Sunday.

Frozen Drinks

If you are having a party, the Ice Cream Maker can help you make wonderful slushy drinks for everyone at once – without using ice. You can even make drinks before your guests arrive and greet them at the door with thick, frosty creations in hand. Although all our recipes are for alcoholic drinks, you can make non-alcoholic ones like slushy lemonade as well. Allow less freezing time to make non-alcoholic drinks slushy and drinkable rather firm like sorbets.

Pina Colada

This is good, it could be a dessert.

One 20-ounce can crushed pineapple, drained 1 cup coconut cream 4 dashes bitters ¼ teaspoon salt 1 cup water 1 cup rum

Purée the pineapple in a food processor. You should have about 1 ½ cups of puree. Place the puree in the bowl of the machine with the remaining ingredients and freeze 25 to 30 minutes depending on how firm you like your drinks. Serves 6.

Banana Daiquiri

3 ripe bananas 1/3 cup fresh lemon juice ¾ cup rum ½ cup superfine sugar

R244 Pour the mixture into the bowl of the ice cream maker and freeze. Please follow

Reference page — normalization and release unresolved. Source S126, PDF page 29.

Original source recipe evidence

Strawberry Balsamic Gelato 7 Strawberries and balsamic are a classic Italian combination which makes this gelato recipe light and refreshing. Ingredients 6 Davidson's Safest Choice® Pasteurized Egg yolks 1 c Plus 4 additional Tbsp granulated sugar 1 c Heavy whipping cream 3 c Whole milk 2 c Fresh strawberries – sliced 2 Tbsp Balsamic cream Preparation

1. Add egg yolks and 1 cup of sugar to bowl of stand mixer. Using the

paddle attachment, mix until light and creamy.

2. While egg yolks are mixing, mix, add milk, heavy whipping cream, and 2

tablespoons sugar into a large, heavy bottom saucepan. Heat over medium heat, stirring frequently until sugar dissolves and mixture warms (but doesn't boil). Remove from heat.

3. Temper egg yolk mixture by adding some of the warm milk/cream mixture.

Gradually pour egg yolk mixture into milk/cream mixture and stir well to combine. Cook over medium heat until mixture thickens/coats the back of a wooden spoon.

4. Remove from heat. Allow mixture to cool.

5. While the mixture is cooling, place strawberries, remaining 2 tablespoons

sugar, and balsamic cream into your blender (or food processor) and puree.

6. Pour pureed strawberries into cream mixture. Stir to combine and transfer

to refrigerator to chill completely.

7. Once chilled, place into your ice cream maker and follow manufacturer's

directions for churning. SafeEggs.com/recipes

Original source recipe evidence

Homemade Cherry Vanilla Ice Cream 11 This no-cook homemade cherry vanilla ice cream is an easy treat you can make at home. Ingredients 6 Davidson's Safest Choice® Pasteurized Eggs 2 c Sugar plus ½ c sugar (divided) 1 can Sweetened condensed milk 2 Tbsp Vanilla 6 c Heavy cream 12 to 16 oz Fresh or frozen pitted cherries. Ice Cream Preparation

1. In a large mixing bowl, beat the eggs together for a minute or two,

add 2 cups sugar and continue mixing for another 2 minutes until eggs and sugar are completely combined.

2. Add vanilla and milk, keep blending until all ingredients are

completely combined.

3. Add milk/egg/sugar mixture to your ice cream machine and follow

manufacturer's directions. Cherries Preparation

1. Add ¾ of the cherries and ½ cup sugar to a small saucepan and heat over

medium heat until cherries soften—about 8 to 10 minutes.

2. Transfer cherries to a blender or food processor and process until smooth.

3. Strain cherry “juice” through a strainer to remove any solids.

4. Put in the freezer for a few minutes to cool.

5. Dice the leftover cherries and put in the freezer.

6. Once the ice cream is nearing completion, open the lid and spoon the cherry

syrup and diced cherries into the ice cream. Use a long spatula to distribute some to the bottom.

7. Turn the ice cream machine back on and let it complete the cycle.

8. When the cycle is complete, put the ice cream container into the freezer until

the ice cream freezes to the desired consistency. SafeEggs.com/recipes

Original source recipe evidence

Drunken Cherry Ice Cream Makes 8 servings This drunken cherry ice cream with the delicious blend of cherries and Grand Marnier is certain to become one of your most loved recipes! Ingredients 1 lb Cherries, pitted ½ c + 2 Tbsp Grand Marnier, divided 1⁄3 c + 2 Tbsp Granulated sugar, divided 1 c Heavy cream 1 c Half and half ½ Tbsp Pure vanilla extract 6 Davidson's Safest Choice ® Pasteurized Egg yolks Preparation

1. Place the cherries in a medium-sized bowl. Add ½ cup Grand Marnier

and 2 tablespoons sugar. Stir well, cover, and refrigerate for a minimum of 30 minutes. Stir periodically so the liquid coats the cherries.

2. Pour the cherries and all liquid from the bowl into a large skillet over

medium-low heat. Stirring frequently, cook the cherries down until they're very soft and the liquid has reduced and thickened substantially, approximately 15 minutes. Allow the cherries to cool briefly and then puree in a blender until smooth. For some texture in the ice cream, don't puree the cherries completely.

3. Heat the heavy cream, half and half, and vanilla in a medium saucepan over

medium-high heat. In a small bowl, vigorously whisk together the egg yolks and 1⁄3 cup sugar. When the cream begins to simmer, turn the heat to low and ladle about half of it into the egg mixture while whisking. Pour the contents of the bowl back into the saucepan, using a spatula to get everything out of the bowl. Over low heat, stir the custard with a heatproof spatula (or wooden spoon) until it thickens up a bit and coats the back of spatula.

4. Allow the ice cream base to cool for several minutes, stirring periodically to

prevent a skin from forming. Take a small taste and if you feel that it needs more Grand Marnier flavor, stir in 1-2 more tablespoons of the liquor. Pour the base into a bowl and cover with plastic wrap, pushing the plastic directly against the liquid. Chill for a minimum of 6 hours, preferably overnight.

5. Prepare ice cream in an ice cream maker according to manufacturer's

instructions. SafeEggs.com/recipes 17

2.5 RECIPE FOR MAKING CULTURE USING FREEZE DRIED CULTURE YOGOURMET

Recipe

1 tsp starter 1 cup milk powder 2 cups water /500ml

Direction

1. pour milk into a pot

2. Add in water.

3. Stir using your hand whisk

4. Place pot of milk on fire. Let it heat up to 180 degree F

5. Leave it to cool for 108 degree F to 112 degree F.

6. remove the milk clot at the top of the milk or sieve to remove particles

7. Take out a little portion into a separate bowl then add in the culture. Stir

until well dissolved

8. Pour the starter mixture into the milk. Then cover it.

9. Leave it in a warm environment for 7-10 hours undisturbed.

10. Bring it out. Give it a mix or strain. Refrigerate immediately

(To make culture , do not add in flavor or sweetener) (while milk is fermenting do not shake or disturb the bacteria).

CHAPTER THREE 3.0 GREEK YOGURT.

Greek yogurt is yogurt that has been strained to remove its whey, resulting in a thicker consistency than that of unstrained yogurt, while preserving yogurt's distinctive sour taste.

What to add to Greek yogurt to make it taste better:

1. A spoonful of heavy cream or half -and-half (especially good if you

want a creamier texture)

2. Vanilla, almond, or lemon extract.

3. Vanilla bean paste (when you're feeling extravagant)

4. A spoonful of sugar or sweetener.

5. Honey.

6. Maple syrup.

7. Spicy, sugared, or toasted pecans.

3.1 RECIPE FOR SWEETENED GREEK YOGURT WITH STABILIZER (4 LITERS)

8 cups powdered milk (1kg) 16 cups water (4 liters) 1 cup sugar (125g) however you can add more sugar from (2 -3 cups your choice) 16 tablespoon culture (1 c up)(if using fermented yogurt culture starter as culture)

Dried fruit lend s some extra sweetness, chewy texture and irresistible fruity flavor It should be added in after the granola is ready else they burn. Eg. dried pineapple , cranberry ,mangoes etc. depending on the variant of granola you are producing.

6) optional mix in Like orange zest , chocolate chips , etc

7) NUTS like almond , cashew nut etc

3.5 BAKED GRANOLA RECIPE

Ingredients 1/2 cup vegetable oil or your preferred cooking oil 1/2 cup honey 1/3 cup light brown sugar 1 tbsp. vanilla extract 1/2 tsp. salt 5 cups Old Fashioned rolled oats 3 cups total of your favorite granola flavors (chopped nuts, dried fruit, shredded coconut, chocolate chunks, etc.)

Instructions Preheat oven to 325 degrees F. Line a (11x17 inch) baking sheet with parchment paper. Add the oil, honey, brown sugar, vanilla, and salt to a large bowl. Whisk until sugar is dissolved and oil is well incorporated. Add the oats and your chosen granola flavors. Stir well.

Pour the oat mixture onto the baking sheet and spread it out into an even layer. Firmly pack the oat mixture into the baking sheet. Bake for 30 minutes, rotating the pan half way through cooking. Let the granola cool at room temperature for one hour. Use a small spoon to scoop up the granola off of the baking sheet. Use the spoon and your hands to break the granola into large chunks. Store at room temperature in a sealed container or zip top bag.

3.6 DRINKABLE / REGULAR SWEETENED YOGURT RECIPE (THICK REGULAR YOGURT)

(4 litres yogurt)

Powdered milk - 8cups /1kg Water. - 4 liters /16 cups Sugar - 400 grams

CULTURE; if using the activated culture directly add 20ml / 4 tsp.

If using the fermented yogurt as culture. Add 16 tbsp.

Flavour : 4 tsp

Preservative: 4g

(1 liter drinkable yogurt)

Powdered milk - 2 cup / 250g

25 Commercial Yoghurt production by Chef Tilda Culinary School

Water. - 1 liter / 4 cups Sugar - 100 grams

CULTURE; if using the activated culture directly add 5ml

If using the fermented yogurt as culture. Add 4 tbsp

Flavour : 1tsp

Preservative: 1g

DIRECTIONS:

1) pour measured milk into a pot. 2) add in sugar 3) add in measured water 4) mix together till there are no lumps , milk powder must be well dissolved 5) place on fire on low heat. Allow the milk yo heat up till you begin to notice foam at the top. Before it boils. (Don‖t allow it boil)

6) place it down and all ow it to cool. Till it is not too hot and not cold. If the milk doesn‖t burn your skin it‖s fine.

7) sieve the milk to remove all particles. Pour milk into a bowl

8) add in culture. Stir for few seconds

9) cover the bowl tightly. Keep milk in a very warm environment.

10) allow it to ferment for 12-15 hours.

11) after fermentation , sieve to weigh out the whey (optional)

CHAPTER FOUR 4.0 RECIPE FOR MAKING CULTURE USING FREEZE DRIED CULTURE SUITABLE FOR LARGE BATCH PRODUCTION. 100 -1000 liters of yogurt.

(Depending on the type of culture company or product your patronize, when you see the word DCU this is what it means) 25 DCU = 250 liters yogurt 50 DCU = 500 liters yogurt 100 DCU = 1000 liters yogurt.

Product of culture I can recommend you use is YOMIX, YOPROX.

If you buy 25 DCU culture, to activate it you must first dissolve it in 250ml / 1 cup of UHT milk .

N:B : this would produce 250 litres of yogurt

If you buy 50 dcu culture , to activate it you must first dissolve it in 500ml /2 cups of UHT milk

N:B ; this would produce 500 litres of yogurt.

If you buy 100 DCU culture , to activate it , you must first dissolve in 1 liter UHT MILK.

N: B. This would produce 1000 litres of yogurt

After activating the culture ,

Original source recipe evidence

29 Commercial Yoghurt production by Chef Tilda Culinary School

When producing yogurt , 5ml of the activated culture should be added to every 1 liter of pasteurized milk.

the left over culture, should be properly kept in a very cold refrigerator/freezer, Till next usage. It must never be left at room temperature kindly note.

If the culture you bought is between 25 -100 DCU. and you don‖t want to activate all to avoid wastage ,

Follow this step.

1) Measure the quantity of culture powder in the pack using your scale. 2) Divide the culture into 2 or 3 or 4 batches equally. According to the quantity of powder in the pack.

3) Divide the UHT milk for the culture into the number of batch you divided the powder.

4) You can decide to use just one batch and keep the rest of the culture powder in the refrigerator for next usage

For example If the culture I bought is in 100 DCU. (To produce 1000 liters of yogurt) which means I am meant to dissolve in 1 liters of UHT milk to activate it before usage.

But I just want to produce 5 liters of yogurt

What I would simply do to avoid wasting my culture powder. Is to Weigh the content. If the content of the pack gives me 16 grams. I would divide the 16 grams into 4. That would be 4g per batch.

I meant to use 1 liter of UHT milk bef ore to dissolve the 100dcu. I would divide that into 4 as well. That would be 1 cup /250 ml per batch.

Original source recipe evidence

30 Commercial Yoghurt production by Chef Tilda Culinary School

I would measure out just 4grams from the culture powder. And dissolve it into just 1 cup of UHT MILK.

I get to keep my remaining unused culture powder in the refrigerator till next usage.

Then make use of my dissolve culture for my yogurt production

4.1 UNDERSTANDING THE DIFFERENT CULTURES STIRRED (YO-FLEX® THERMOPHILIC CULTURES)

YC-X11 – Gives a mild flavour with smooth viscosity. Ideal for stirre d or drinking yogurts. YC-180 – Gives a medium flavour with medium -thick viscosity. YC-280 – Gives a medium flavour with thick viscosity. YC-370 – Gives a strong/tangy flavour with light viscosity. YC-380 – Gives a strong/tangy flavour with medium -light vi scosity. YC-381 – Gives a strong/tangy flavour with medium-thick viscosity.

SET (YO-FLEX® THERMOPHILIC CULTURES)

YC-X11 – Gives a mild flavour with smooth viscosity. Ideal for set or stirred yogurts. YF-L811 – Gives a mild flavour with firm viscosity. F-812 – Gives a very mild flavour with medium -firm viscosity. YF-3331 – Gives a medium - strong flavour with medium-thin viscosity. CH-1 Gives a strong tangy flavour with medium-firm viscosity. ADDITIONAL YOGURT CULTURE ENZYMES NOLA-FIT – An innovative enzyme that reduces lactose in yogurt and other fermented milk products, and can even reduce sugar.

4. Bring down and allow to cool.

5. Transfer to a blender or food processor and blend or

grinder and grind it.

6. Transfer to a sieve to sieve it into powdery form.

7. Return the remaining part and regrind or re-blend and

sieve again to powdery form till it is finished.

8. Transfer to a container and store in a dry place.

9. Use it as food supplements, add to your bread flour and

bake bread or make it as porridge or add to your baby feed or use as organic tea. Percentage of Soy flour to add for bread mixing: Add between 2% to 5%. Example: Add 100g to 5kg or 5000g of your normal white hard bread flour. 200g to 10kg, 300g to 15kg, 400g to 20kg etc.

Original source recipe evidence

Bread Baking University by Chef Hwnry 54 Next, cut and scale and shape into pans and keep to rise almost to the top of the pan and bake.

Note: If you are making butter bread, there are two things you need to know: Use Butter Cream Industrial flavour. If baking Sweet bread, use Milk Supreme flavour. You can also make very unique bread by combining the above flavour with condensed milk flavour.

When making a butter bread, increase your percentage of margarine in your mixing to 7% to 10% of the total flour. For example, for 10kg of flour, your margarine percentage is 700g to 1kg

Original source recipe evidence

Commercial Baguette Production Guide Optimizing artisan formulation for 50kg spiral mixers, mechanical molders, and 16-tray rotary ovens. Part 1: The Challenge of the Baguette Authentic French baguettes are notoriously difficult to master because their simplicity leaves no room for error. Relying entirely on flour, water, salt, and yeast, the final quality depends entirely on technique and environmental control. High Hydration vs. High Tension: Dough typically requires 65% to 75% hydration to achieve an open crumb (l'alvéolage). The challenge lies in maintaining structural tension in a wet dough without overhandling. The Art of Shaping: Bakers must build surface tension while avoiding over-degassing, which destroys internal cell structure. Precise Scoring: Slashing with a razor blade at a 30-to-45-degree angle ensures an even rise (oven spring) instead of side ruptures. The Steam Dilemma: Steam is critical during the first 10 minutes of baking to keep the skin elastic and gelatinize surface starches for a crackly crust. Part 2: Adapting to Industrial Equipment Transitioning from hand-shaping to machinery requires structural adjustments to your process to ensure consistent quality at scale. Spiral Mixer Friction: Commercial mixers generate intense heat. Ice or chilled water must be utilized to maintain a strict final dough temperature of 23°C to 24°C. Molder Tolerance: To prevent sticking or tearing in mechanical rollers, target a highly stable 65% to 68% hydration level. Avoid overly tight rollers to protect internal air bubbles. Rotary Convection Management: Moving hot air dries dough rapidly. Heavy steam must be injected immediately upon loading before the crust bakes shut. Part 3: 80-Baguette Batch Formulation (1 Full Rack) Based on standard 16-tray capacity (5 baguettes per tray) with 300g scaling weight to yield a 250g baked loaf after accounting for 15% bake loss. Ingredient Baker's % Weight Industrial Role / Notes Bread Flour 100% 14.20 kg T55 style / 11.5%-12% protein content. Commercial Baguette Production Guide Page 1 of 2 This document provides general operational guidelines for bakery machinery.

Ice Water 66% 9.37 kg Target 4°C to offset intense spiral friction. Salt 2.0% 284 g Crucial for gluten strength and crumb flavor. Instant Dry Yeast 0.5% 71 g Standard dry yeast (e.g., Saf-Instant Red). Total Dough 168.5% 23.93 kg Yields exactly 80 scaled pieces. Part 4: Step-by-Step Industrial Workflow

1. 1. Mixing: Combine flour, yeast, and 80% ice water. Mix on Speed 1 for 3 mins. Autolyse for 10 mins. Add

salt and remaining water. Mix on Speed 2 for 4-5 mins until dough reaches 23°C-24°C. Bulk ferment for 45 mins.

2. 2. Processing: Divide into 300g portions. Preshape loosely. Rest for 15-20 mins to relax gluten.

3. 3. Molding: Pass through the molder with gentle clearances. Place 5 pieces per perforated tray.

4. 4. Proofing: Insert rack into proofer at 26°C with 75%-80% humidity. Proof for 60-90 minutes.

5. 5. Baking: Preheat rotary oven to 240°C. Score loaves with 5 overlapping cuts. Load rack and immediately

inject steam for 15-20 seconds. Drop temperature to 220°C and bake for 20-22 minutes. Open damper for final 3 minutes. Commercial Baguette Production Guide Page 2 of 2 This document provides general operational guidelines for bakery machinery.

R286 Professional Popsicle production

Reference formulation — not released for production. Source S035, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner’s workbook margarine.

Original source recipe evidence

Professional Popsicle production

The best formula for professional-grade popsicles relies on a precise sugar-to-water balance to prevent rock-hard ice crystals, specifically maintaining a total sugar concentration between 20% to 30% Brix (by weight) . This exact calculation is the industrial secret to achieving a smooth, biteable texture that replicates high-end artisanal paletas rather than icy blocks. [1 , 2 , 3] The Master Formulas Depending on your product line, use these two baseline metric formulas per 1,000 grams (1 kg) of total liquid base.

1. Professional Fruit Pop (Sorbet Style)

Fruit Puree / Juice : 500g to 600g (Filtered, strained, or finely blended) Water / Liquid Base : 200g to 250g Sugars : 150g to 180g (Combination of table sugar and liquid sugar like invert sugar or glucose syrup to inhibit crystallization) Acid (Lemon/Lime Juice) : 15g to 20g (Brightens flavor and balances sweetness profile) Professional Stabilizer : 2g to 3g (Guar gum or xanthan gum dissolved in the warm syrup) [1 , 2 , 3 , 4 , 5 , 6 , 7]

2. Professional Creamy Pop (Gelato Style)

Whole Milk : 400g Heavy Cream (36% fat) : 250g Sugar : 120g Skim Milk Powder : 40g (Boosts solids without adding water, enhancing creaminess) Condensed Milk : 150g Cornstarch or Stabilizer : 10g (Cooked into the base to bind water) Flavoring : 15g (Pure vanilla bean paste or high-grade cocoa) [1 , 2 , 3 , 4 , 5]

Key Science Elements for Professional Production ┌──┐ │ THE SOLID-TO-LIQUID RATIO │ ── │ Water Content (~70-75%) │ Total Solids (~25-30%) │ │ Provides structural yield │ Sugar, Fat, Stabilizers │ │ and refreshing coldness. │ Suppresses freezing point. │ └──┘ Freezing Point Depression : Sugar acts as an anti-freeze. If your formula has too little sugar, the pop will be a hard brick. If it has too much sugar, it will not freeze solid or will melt immediately upon removal. Use a refractometer to measure Brix before freezing. [1 , 2 , 3 , 4 , 5] The Sugar Split : Substitute 25% of your standard white granulated sugar with liquid glucose or atomized glucose. This lowers sweetness intensity while adding body, creating a velvety chew rather than a granular crunch. Stabilizer Mechanics : Never skip stabilizers for commercial production. Using Guar Gum at roughly 0.2% of your mix weight thickens the un-frozen liquid, traps water molecules, and prevents massive ice crystals from forming during the slow-freezing cycle. [1 , 2] Over-Flavoring Rule : Cold numbs human taste buds. A professional popsicle base must taste slightly oversweet and aggressively flavored at room temperature so that it tastes perfectly balanced once frozen. [1 , 2] Production Workflow Blend : Thoroughly blend fruits, liquids, and sugars. [1 , 2] Hydrate : Mix your gum/stabilizer with a portion of dry sugar, whisk it into your liquid base, and let it rest for 30 minutes to fully hydrate. [1] Molding : Pour into commercial stainless steel or food-grade silicone molds . [1 , 2 , 3 , 4] Flash Freeze : Blast freeze or use a brine tank system to drop the temperature to -20°C (-4°F) as rapidly as possible to guarantee micro-crystals. [1 , 2 , 3]

Professional Shawarma Garlic Sauce Recipes

Optimized for 30L Commercial Jacketed Mixing Tanks

---

1. Authentic Lebanese Toum (Pure Oil Emulsion)

Characteristics: Fluffy like cloud/frosting, sharp garlic punch, traditional artisan style. Higher technical skill required.

Ingredients (10-Liter Yield)

* **Fresh Garlic Peeled:** 1.5 kg (De-sprouted) * **Neutral Oil (Sunflower or Canola):** 8.0 Liters * **Fresh Lemon Juice:** 450 ml * **Ice-Cold Water:** 250 ml * **Fine Sea Salt:** 70 grams

Commercial Tank Operation Steps

1. **The Garlic Grind (High Speed):** Add garlic and salt. Ensure tank heating is **OFF**. Pulverize into a completely smooth paste.

2. **The Slow Thread (Medium-High Speed):** Drizzle oil in a very slow, continuous thin stream.

3. **The Alternating Dance:** Once thick, alternate adding a splash of lemon juice and a slow stream of oil until fully incorporated.

4. **The Finish (Low Speed):** Slowly fold in ice-cold water to whiten, mellow, and glossy finish the sauce.

---

2. Fast-Food Style Yogurt-Mayo Sauce (Milder & Cost-Effective)

Characteristics: Highly stable, creamier, easier to spread, low risk of separating, cost-efficient.

Ingredients (10-Liter Yield)

* **Commercial Mayonnaise:** 5.5 Liters * **Plain Thick/Strained Yogurt:** 3.5 Liters * **Fresh Garlic Peeled:** 500 grams * **Fresh Lemon Juice:** 250 ml * **White Vinegar:** 100 ml * **Fine Salt:** 40 grams * **White Pepper:** 15 grams * **Dried Mint (Secret Ingredient):** 2 tablespoons

Commercial Tank Operation Steps

1. **The Garlic Puree (High Speed):** Blend lemon juice, vinegar, and garlic into a completely smooth, pulp-free liquid.

2. **The Base Blend (Medium Speed):** Add salt, white pepper, dried mint, and yogurt. Mix for 30 seconds.

3. **The Final Bind (Low Speed):** Add mayonnaise. Let the scraper blades gently fold until uniform (1–2 minutes).

Pro-Tips for Commercial Bakery Scale

* **Flavor Cross-Contamination:** Deeply clean and sanitize the bottom discharge valve of your 30L tank. Moving directly from garlic to sweet bakery batches (like yogurt or glazes) without chemical cleaning will ruin flavors. * **Temperature Management:** Mixers generate friction heat. Keep oil, yogurt, and water chilled before processing to prevent emulsion breakage. * **The Yogurt Trick:** Use your own house-made bakery yogurt (strained) to cut raw ingredient costs dramatically.

R288 baguette recipe

Reference formulation — not released for production. Source S071, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner’s workbook margarine.

Original source recipe evidence

To get the perfect French baguette recipe for professional bakery production, focus on mastering hydration, fermentation, shaping, and steam baking. Below is a detailed guide based on proven bakery-level techniques.

Professional French Baguette Recipe Guide Ingredients (for 6 baguettes) 1000g bread flour (high-protein, unbleached) 700g water (70% hydration for open crumb) 20g salt 2g instant yeast (or 5g fresh yeast) Step-by-Step Instructions

1. Mixing and Autolyse

Combine flour and water only. Let rest for 30–60 minutes (autolyse improves gluten development and flavor).

2. Add Yeast and Salt

Mix in yeast and salt after autolyse . Knead until dough is smooth and elastic (10–15 minutes by hand or 8 minutes in mixer).

3. Bulk Fermentation

Place dough in a lightly oiled container. Cover and ferment at room temperature (22–24°C) for 2–3 hours , folding every 30 minutes.

4. Cold Retardation (Optional but Recommended)

Refrigerate dough overnight (8–12 hours) to enhance flavor and crust.

5. Divide and Pre-shape

Divide into 6 portions (~300g each) . Pre-shape into loose logs and rest for 20 minutes .

6. Final Shaping

Shape into classic baguette form: long, tight cylinders with pointed ends. Place on floured couche or perforated baguette trays.

7. Final Proof

Proof for 45–60 minutes at room temperature until slightly puffy.

8. Scoring

Use a lame or razor blade to make 3–5 diagonal slashes at a shallow angle.

9. Steam Baking

Preheat oven to 250°C (480°F) . Bake with steam for first 10 minutes (use lava rocks, water tray, or sprayer). Bake for 20–25 minutes total until deep golden brown.

Pro Tips for Bakery-Level Results Steam is critical : It delays crust formation, allowing full oven spring and glossy crust. Use high hydration : 70–75% water gives open crumb and chewy texture. Cold fermentation : Enhances flavor complexity and crust crispness. Proper shaping and scoring : Prevents blowouts and ensures uniform expansion. Use a baking stone or steel : For even heat and crisp bottom crust.

Shaping Variations Classic baguette : Long and slender with pointed ends. Épi de blé : Snipped with scissors to resemble wheat stalks. Ficelle : Thinner version for crispier crust.

R289 burger buns recipe

Reference formulation — not released for production. Source S072, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Original source recipe evidence

For a professional hamburger, start with soft, golden buns made with milk and butter, then pair with juicy beef patties and fresh, balanced fillings. Here's a full bakery-grade recipe and restaurant-style assembly guide.

Professional Hamburger Bun Recipe Adapted from Voyo Eats and BAKERpedia Ingredients (for 20 buns) Bread flour – 2kg Water – 1L Milk powder – 100g Sugar – 200g Salt – 40g Instant yeast – 40g Butter or margarine – 200g Eggs – 4 Bread improver – 20g (optional) Egg wash – 2 eggs + 2 tbsp milk Sesame seeds – optional Procedure Mixing : Combine dry ingredients. Add water, eggs, and softened butter. Knead until smooth and elastic. Bulk Fermentation : Rest dough for 1 hour at 26–28°C. Scaling & Shaping : Divide into 100g portions. Shape into tight balls. Proofing : Let rise for 45–60 minutes until doubled. Glazing : Brush with egg wash. Sprinkle sesame seeds. Baking : Bake at 190°C for 15–18 minutes until golden brown. Cooling : Cool completely before slicing. Tip : Use steam in the oven for the first 5 minutes to improve softness and crust sheen.

Professional Beef Patty Recipe Adapted from Savory Experiments and Natasha’s Kitchen Ingredients (for 10 patties) Ground beef (80/20) – 1.5kg Salt – 20g Black pepper – 10g Garlic powder – 10g Worcestershire sauce – 2 tbsp (optional) Procedure Mix gently : Combine ingredients without overworking. Shape : Form into 150g patties, slightly wider than buns. Chill : Refrigerate for 30 minutes to firm up. Cook : Grill or pan-sear for 3–4 minutes per side until internal temp reaches 70°C. Rest : Let rest 2 minutes before assembling. Tip : Press a thumbprint in the center to prevent doming during cooking.

Fillings for a Professional Finish Essentials Cheese slices (cheddar, gouda, or mozzarella) Lettuce (iceberg or romaine) Tomato slices Pickles or cucumber Red onion rings Sauces Mayonnaise Ketchup Mustard Burger sauce (blend of mayo, ketchup, mustard, paprika) Assembly Tips Toast buns lightly for texture. Layer: bottom bun → sauce → lettuce → patty → cheese → tomato → onion → top bun. Wrap in parchment or serve in branded boxes for presentation.

R290 Kumba bread and Cassava bread 2 most valued Cameroonian bakery breads

Reference formulation — not released for production. Source S073, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner's workbook margarine.

Original source recipe evidence

Here are two of the most valued Cameroonian bakery breads—Kumba Bread and Cassava Bread—along with professional recipes and essential tips for bakery success.

1. Kumba Bread (Cameroonian Sandwich Bread) Kumba Bread is a soft, slightly sweet sandwich loaf popular across Cameroon. It's similar to Nigeria's Agege Bread and ideal for breakfast or snacks. Ingredients (for 10 loaves) Bread flour – 5kg Water – 2.5L (50% hydration) Sugar – 400g Salt – 100g Margarine – 300g Yeast – 50g (instant) Milk powder – 200g (optional for richer flavor) Bread improver – 10g (optional for softness and shelf life)Procedure Mixing : Combine dry ingredients. Add water gradually and mix until dough is smooth. Kneading : Knead for 10–12 minutes until elastic. Bulk Fermentation : Rest dough for 1 hour at room temperature. Scaling & Moulding : Divide into 500g portions. Shape into loaves. Proofing : Let rise in pans for 45–60 minutes until doubled. Baking : Bake at 180°C for 30–35 minutes. Cooling : Cool completely before packaging. Tip : Use steam in the oven for the first 10 minutes to improve crust softness and oven spring. Source: Precious Core

2. Cassava Bread (Gluten-Free Traditional Bread) Cassava Bread is a rustic, gluten-free option made from cassava flour, cherished for its earthy flavor and chewy texture. Ingredients (for 10 medium loaves) Cassava flour – 2kg Warm water – 1L Sugar – 100g Salt – 40g Vegetable oil – 100ml Yeast – 20gProcedure Activate Yeast : Mix sugar and yeast in warm water. Let sit for 10 minutes. Mix Dough : Combine cassava flour, salt, oil, and yeast mixture. Knead : Knead until smooth and slightly sticky. Ferment : Let rise for 1 hour. Shape & Proof : Shape into loaves and proof for 30–45 minutes. Bake : Bake at 200°C for 25–30 minutes until golden. Tip : Cassava flour absorbs water differently—adjust hydration based on texture. Source: Culinary Creations

Success Tips for Cameroonian Bakery Products Product Quality Use fresh yeast and high-quality flour . Control fermentation time to avoid sourness or poor texture. Standardize recipes using baker's percentages for consistency. Business Strategy Offer popular combos like Kumba Bread + Ovaltine or Cassava Bread + beans. Diversify shapes and sizes to appeal to different customer segments. Label clearly with production date and shelf life. Hygiene & Packaging Maintain strict hygiene in production and packaging. Use food-grade bags and seal properly to extend freshness. Marketing Promote through local shops, schools, and markets . Offer free samples to build customer loyalty. Highlight local ingredients and traditional value.

R291 Pain au lait

Reference formulation — not released for production. Source S074, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner’s workbook margarine.

Original source recipe evidence

The most valued professional Pain au Lait recipe in Cameroonian bakeries features a soft, slightly sweet milk-enriched dough, ideal for breakfast or snacks. It’s prized for its pillowy texture, golden crust, and subtle aroma.

Professional Pain au Lait Recipe (Cameroon Bakery Style) This recipe is adapted from both local Cameroonian bakery practices and international standards like those from Puratos and French boulangeries. Ingredients (for 10 loaves or ~60 rolls) Ingredient | Weight (grams) | Baker’s % Bread flour | 5000g | 100% Water | 2750g | 55% Sugar | 750g | 15% Salt | 100g | 2% Milk powder | 250g | 5% Instant yeast | 100g | 2% Butter or margarine | 500g | 10% Bread improver (optional) | 50g | 1% Vanilla or nutmeg (optional) | to taste | —

Professional Method

1. Mixing

Combine all dry ingredients in a spiral mixer. Add water gradually and mix on low speed for 3 minutes , then high speed for 6–8 minutes . Add butter last and mix until fully incorporated. Target dough temperature: 26–28°C .

2. Bulk Fermentation

Rest dough in a covered bin for 15–20 minutes .

3. Scaling & Pre-shaping

Divide into 80g–100g portions for rolls or 500g for loaves. Pre-shape into balls or logs. Rest for 10 minutes .

4. Final Shaping

Shape into ovals or long rolls. Place on greased trays or in loaf pans.

5. Final Proof

Proof at 30–32°C with 75–85% humidity for 60–90 minutes , until doubled.

6. Scoring & Glazing

Score tops with a razor blade (3 diagonal cuts). Brush with egg wash (1 egg + 1 tbsp milk) for shine.

7. Baking

Bake at 220–230°C for 12–15 minutes (rolls) or 25–30 minutes (loaves). Optional: apply a second egg wash halfway through baking for extra gloss.

Pro Tips for Success Use milk powder for better shelf life and flavor than fresh milk. Control fermentation to avoid over-proofing, which causes collapse. Steam during the first 5 minutes of baking improves crust softness and volume. Cool completely before packaging to avoid condensation.

Why It’s Popular in Cameroon Loved for its soft, rich crumb and slightly sweet taste . Often sold in individual rolls or mini loaves for school snacks and breakfast. Pairs well with tea, coffee, or chocolate spread.

Original source recipe evidence

D anisa biscuits how to reproduce it the professional way and get the reaal high quality product in the bakery Copilot said: Copilot To professionally reproduce Danisa-style Danish butter cookies in a bakery and achieve high-quality results, you’ll need to focus on both authentic ingredients and precise baking techniques . Here's a comprehensive guide based on expert sources 1 2 3 :

Ingredients for Authentic Danisa-Style Butter Cookies Use high-quality ingredients to replicate the rich flavor and delicate texture: European-style butter (e.g., Kerrygold) – high butterfat content for flavor and texture Granulated sugar – for sweetness and slight crunch Powdered sugar – optional, for a softer dough and better piping Egg yolks – for richness and binding Vanilla extract or paste – for depth of flavor All-purpose flour – for structure Milk – to adjust dough consistency for piping

Professional Baking Process Creaming the Butter and Sugar Use a stand mixer to cream softened butter and sugar until light and fluffy. This step is crucial for texture and aeration. Add Egg Yolks and Vanilla Mix until fully incorporated. The mixture may look slightly curdled—this is normal. Incorporate Flour Gradually add flour and mix until a thick, pipeable dough forms. Add a splash of milk if the dough is too stiff. Piping the Dough Use a star piping tip (e.g., Ateco #827 or Wilton 1M) to pipe into classic swirl or pretzel shapes. Pipe onto non-stick baking mats or parchment paper. Chilling (Optional but Recommended) Chill piped cookies for 15–30 minutes to help retain shape during baking. Baking Bake at 160–180°C (320–356°F) for 12–15 minutes until edges are golden. Use convection ovens for even baking in commercial settings. Cooling Cool on wire racks or conveyor systems to stabilize texture and prevent sogginess. Packaging Use flow wrapping machines or tin packaging for freshness and presentation.

Commercial Production Tips For bakery-scale production, consider: Spiral or planetary mixers for consistent dough mixing Wire-cut or sheet roller machines for shaping (if not piping) Tunnel ovens for high-volume baking Multi-tier cooling conveyors for efficient cooling Automated packaging lines for hygiene and speed 4 5

R293 Delicious breads classic French Baguette rich Italian Ciabatta and soft Japanese Milk Bread

Reference formulation — not released for production. Source S081, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner’s workbook margarine.

Original source recipe evidence

Of course. Here are the recipes and large-scale manufacturing processes for three of the world's most beloved and delicious breads: classic French Baguette, rich Italian Ciabatta, and soft Japanese Milk Bread.

---

1. French Baguette

The epitome of simplicity and technique, a perfect baguette has a crisp, shattering crust, an airy, open crumb with irregular holes, and a complex, slightly sweet flavor derived from a long fermentation.

**Artisan Recipe (Makes 2 baguettes):* *

* **500g** Bread Flour (high protein) * **350g** Water (70% hydration), cool * **10g** Salt * **4g** Instant Yeast * ** Optional:* * 50g Poolish (pre-ferment made a day ahead with 50g water, 50g flour, and a pinch of yeast)

** Method:* *

1. **Mix & Autolyse:* * Mix flour and water until just combined. Let rest (autolyse) for 30 minutes. This allows the flour to hydrate and gluten to develop naturally.

2. ** Knead:* * Add salt and yeast. Knead for 8-10 minutes until smooth and elastic.

3. **Bulk Ferment:* * Let the dough rise in a greased bowl for 1-1.5 hours, performing a series of "folds" every 30 minutes to strengthen the gluten.

4. **Divide & Pre- shape:* * Gently divide the dough into two equal pieces. Pre-shape into loose rectangles and rest for 20 minutes.

5. ** Shape:* * Gently press the rectangle flat, then fold and roll into a long, tight log, tapering the ends. Place seam-side down in a floured couche cloth to hold its shape.

6. **Final Proof:* * Proof for 45-60 minutes until slightly puffy.

7. **Score & Bake:* * Preheat oven to 475°F (245°C) with a baking stone and steam pan. Score the tops of the loaves with a sharp lame (razor). Bake for 20-25 minutes, injecting steam for the first 10 minutes, until deep golden brown.

---

2. Ciabatta (Italian Slipper Bread)

Known for its distinctive flat, elongated shape, ciabatta has a crisp, flour-dusted crust and a moist, chewy, hole-filled interior. It's characterized by its very high hydration dough.

**Artisan Recipe (Makes 2 loaves):* *

* **500g** Bread Flour * **400g** Water (80% hydration), warm * **10g** Salt * **5g** Instant Yeast * **50g** Olive Oil

** Method:* *

1. **Biga (Pre-ferment):* * The night before, mix 200g of the flour, 130g of the water, and a pinch of yeast. Cover and ferment for 12-16 hours until bubbly.

2. ** Mix:* * The next day, combine the biga with the remaining flour, water, yeast, and salt. Mix on low speed until a very wet, sticky, and shaggy dough forms.

3. **Develop Gluten:* * This dough is too wet to knead traditionally. Instead, use the "stretch and fold" technique. Every 30 minutes for 2 hours, wet your hands, grab one side of the dough, stretch it up, and fold it over the center . Repeat for all four "sides."

4. ** Ferment:* * After the folds, let the dough rest for another hour until extremely bubbly and airy.

5. ** Shape:* * Heavily flour your work surface and hands. Gently pour the dough out, trying to degas it as little as possible. Cut it into two rectangles with a bench scraper. Fold each piece loosely into a "slipper" shape.

6. **Final Proof:* * Place the loaves on a well-floured couche or kitchen towel and proof for 45-60 minutes.

7. ** Bake:* * Carefully transfer the proofed loaves to a parchment-lined baking sheet or preheated stone. Bake at 450°F (230°C) for 22-28 minutes with steam until golden and the internal temperature reaches 210°F (99°C).

---

3. Japanese Milk Bread (Hokkaido Milk Bread)

Renowned for its impossibly soft, fluffy, and pillowy texture, this bread is slightly sweet and milky. Its unique texture comes from a cooked flour paste starter called a " Tangzhong " or " Yudane ."

**Artisan Recipe (Makes 1 loaf):* *

* **Tangzhong :* * *** 45g **Bread Flour *** 225g **Water (or milk) *** Dough:* * * **385g** Bread Flour * **60g** Sugar * **8g** Salt * **10g** Instant Yeast * **125g** Warm Milk * **1** Large Egg * **60g** Unsalted Butter, softened

** Method:* *

1. ** Tangzhong :* * Whisk flour and water/milk in a saucepan. Cook over medium heat, stirring constantly, until it thickens to a paste. Let cool to room temperature.

2. ** Mix:* * In a stand mixer, combine all dough ingredients, including the tangzhong . Knead for 5-7 minutes until a smooth dough forms. Add the soft butter and knead for another 5-7 minutes until the dough is very smooth, elastic, and passes the "windowpane test."

3. **Bulk Ferment:* * Place dough in a greased bowl, cover, and let rise for 60-90 minutes until doubled.

4. **Divide & Shape:* * Punch down the dough. Divide into 4 equal pieces. Roll each piece out into an oval, then fold it letter-style (top third down, bottom third up). Roll this folded piece out into a long rectangle and roll it up tightly into a swirl (like a cinnamon roll).

5. **Final Proof:* * Place the 4 swirls seam-side down in a row in a greased 9x5 inch loaf pan. Cover and proof for 45-60 minutes until the dough rises just above the rim of the pan.

6. ** Bake:* * Brush the top with an egg wash (optional). Bake at 350°F (175°C) for 30-35 minutes until the top is deep golden brown. Immediately brush with melted butter for a soft crust.

How They Are Manufactured at Large Scale

The principles remain the same, but the equipment is industrial and the process is highly controlled for consistency, speed, and volume.

**Common Large-Scale Process (Applied to all breads with adjustments):* *

1. **Ingredient Scaling:* * Automated silos and meters deliver precise weights of flour, water, yeast, salt, and other ingredients directly into giant mixers. This is done by computer-controlled systems for absolute accuracy.

2. ** Mixing:* * High-capacity spiral or horizontal mixers handle hundreds of pounds of dough at once. The mixing time, speed, and temperature are precisely controlled. Water temperature is often adjusted with a "water chiller" to control dough temperature.

3. **Fermentation/Bulk Fermentation:* *

*** For Baguette/Ciabatta (Long Fermentation):* * The dough is transferred to massive, temperature- and humidity-controlled fermentation tanks or troughs. These can be programmed for specific rest times and can even perform**

automated "folding." * For Milk Bread (Shorter Fermentation):* * The dough may move directly to a divider after a short rest.

4. ** Dividing:* * The large mass of dough is fed into a divider that uses pressurized air or pistons to cut it into pre-set weights with extreme accuracy.

5. ** Rounding:* * The divided pieces are dropped into a rounder, which shapes them into smooth balls to create a skin, preparing them for sheeting and final shaping.

6. **Intermediate Proofing:* * The rounded dough balls travel on a conveyor through a proofer—a warm, humid tunnel—to relax the gluten before final shaping.

7. **Sheeting & Final Molding :* *

* **Baguette:* * Dough pieces pass through a series of rollers and then under a "curtain" that rolls them into the classic long shape. *** Ciabatta:* * Often deposited by a hopper directly onto baking sheets or peels with minimal shaping to retain its irregular shape. * **Milk Bread:* * Automated machinery rolls out the dough, applies any fillings, and rolls it into the perfect swirl before placing it into automated loaf pan de-panners.

8. **Final Proofing:* * The shaped loaves enter a massive, multi-level final proofer. Here, temperature and humidity are perfectly controlled to achieve the ideal rise.

9. ** Baking:* * The proofed loaves enter a tunnel oven or a multi-deck oven on a conveyor belt. The oven has different zones with precisely controlled top and bottom heat and steam injection (crucial for baguettes and ciabatta). Baking times are exact.

10. **Cooling & Packaging:* * After baking, the bread travels on a long cooling conveyor (for up to 2 hours!) to reach room temperature and finish setting its crumb. It is then automatically sliced (if required) and packaged for distribution.

Original source recipe evidence

Here’s a detailed professional recipe to reproduce Danisa-style Danish butter cookies in a bakery setting. This version is scaled for small-batch commercial use but can be adjusted for larger production.

Danisa-Style Danish Butter Cookies (Professional Bakery Recipe) Yield: Approx. 100 cookies (depending on size and shape)

Ingredients: Ingredient | Weight (grams) | Notes Unsalted butter | 500 g | Use European-style butter (82–85% fat) Granulated sugar | 200 g | Fine white sugar Egg yolks | 4 large | Room temperature Vanilla extract | 10 g (2 tsp) | Or use vanilla paste for richer flavor All-purpose flour | 600 g | Sifted Whole milk | 30–50 g | Adjust for piping consistency Salt | 2 g | Optional, enhances flavor

Instructions:

1. Creaming

In a stand mixer with paddle attachment, cream butter and sugar on medium speed for 3–5 minutes until pale and fluffy. Scrape down the sides of the bowl.

2. Add Egg Yolks and Vanilla

Add yolks one at a time, mixing well after each addition. Add vanilla extract and mix until smooth.

3. Incorporate Flour

Gradually add sifted flour on low speed. Mix just until combined—do not overmix.

4. Adjust Consistency

Add milk gradually until the dough is soft enough to pipe but still holds shape. Test with a piping bag and star tip.

5. Piping

Pipe dough onto parchment-lined trays in classic swirl, ring, or pretzel shapes. Leave space between cookies.

6. Chill (Optional)

Chill trays for 15–30 minutes to help cookies hold shape during baking.

7. Bake

Bake at 170°C (340°F) in a convection oven for 12–15 minutes or until edges are golden. Rotate trays halfway through for even baking.

8. Cool

Let cookies cool on trays for 5 minutes, then transfer to wire racks.

9. Packaging

Once fully cooled, pack in airtight tins or flow-wrap for freshness.

Pro Tips for Bakeries: Use butter with high fat content for authentic flavor . Avoid margarine or shortening—Danisa’s signature taste comes from real butter. For large-scale production, use pneumatic piston depositors for consistent piping. Store in a cool, dry place to maintain crispness.

Professional French Baguette Recipe & Technique Traditional Formula (Makes 8-10 baguettes, 250g each) Ingredients: Bread flour : 1000g (12.5-13% protein content - crucial) Water : 750ml (75% hydration) Sea salt : 20g (2%) Fresh yeast : 3g OR Dry active yeast: 1.5g (0.3% for long fermentation) Diastatic malt powder : 2g (optional, improves crust color) Baker's Percentages: Flour: 100% Water: 75% Salt: 2% Yeast: 0.3% Professional Equipment Required Spiral mixer or stand mixer with dough hook Digital scale (1g accuracy) Thermometer for water and dough temperature Proofing baskets (bannetons) or couche cloth Baguette boards or transfer peels Razor blade or lame for scoring Steam injection oven or home oven with steam setup Baking stone or deck oven Professional Method - Day 1 (Pre-ferment Method) Step 1: Poolish Preparation (Evening Before) Poolish Formula:

- Flour: 200g

- Water: 200g (room temperature)

- Fresh yeast: 0.5g

Mix poolish ingredients until smooth Cover and ferment at room temperature (20-22°C) for 12-16 hours Poolish is ready when bubbly, tripled in size, and starts to recede Professional Method - Day 2 (Final Dough) Step 2: Autolyse (Water and Flour Rest) Time: 30 minutes Water temperature calculation : Target dough temperature: 24-26°C Formula: (Target temp × 3) - (Room temp + Flour temp + Mixer friction*) *Mixer friction typically adds 8-12°C Mix flour and water only Cover and rest for 30 minutes This develops gluten naturally without overworking Step 3: Final Dough Mixing Mixing time: 12-15 minutes total Add poolish to autolyse mixture Mix on slow speed (1st speed) for 3 minutes Add salt, continue mixing slow speed for 4 minutes Increase to medium speed (2nd speed) for 5-8 minutes Target dough temperature : 24-26°C Gluten development test : Windowpane test - dough should stretch thin without tearing Step 4: Bulk Fermentation (Primary Rise) Time: 3-4 hours with folds Temperature : 24-26°C (critical for proper fermentation) Folding schedule : 30 minutes : First fold (strengthen gluten) 60 minutes : Second fold 90 minutes : Third fold Remainder : Undisturbed rise Folding technique : Wet hands to prevent sticking Grab one side of dough, stretch up and fold over Rotate bowl 90°, repeat 4 times This builds strength without degassing Ready indicators : Dough increased 70-80% in size Feels light and airy Gentle poke test: slow spring-back Step 5: Pre-shaping Rest time: 20-30 minutes Divide dough : 8-10 pieces of 250g each (use scale for consistency) Pre-shape : Form loose rounds using bench scraper Bench rest : Cover with damp cloth, rest 20-30 minutes Dough should relax but not spread excessively Step 6: Final Shaping (Critical Technique) Baguette shaping method : Flatten gently : Pat dough into rectangle, don't degas completely Letter fold : Fold top third down, bottom third up Seal seam : Use heel of palm, don't overwork Roll technique : Start from center , roll outward with both hands Apply gentle, even pressure Roll to 60-65cm length Taper ends naturally Quality indicators : Even thickness throughout Smooth, tight surface No tears or weak spots Proper length-to-width ratio Step 7: Final Proofing Time: 45-60 minutes Temperature : 26-28°C Humidity : 75-80% Setup options : Couche method : Place seam-side up on floured linen Banneton method : Seam-side down in floured baskets Ready test : Gentle poke test: slow spring-back (not full return) Increased size by 50% Slightly jiggly when moved Professional Baking Technique Step 8: Scoring (Le Grigne) Timing : Immediately before baking Technique : Blade angle : 30-45° to surface Depth : 6-8mm deep Length : Each cut 10-12cm long Overlap : Cuts should overlap by 2-3cm Number : 5-7 cuts per baguette Speed : Quick, confident strokes Step 9: Steam and Baking Oven temperature : 240°C (465°F) initial, reduce to 220°C (425°F) Steam generation (First 15 minutes): Professional : Steam injection system Home method : Cast iron pan with boiling water + ice cubes Baking schedule : 0-2 minutes : Maximum steam, 240°C 2-15 minutes : Continue steam, maintain 240°C 15-25 minutes : Release steam, reduce to 220°C Total time : 22-25 minutes Doneness indicators : Internal temperature: 96-98°C Deep golden-brown color Hollow sound when tapped Crispy, singing crust Quality Standards & Troubleshooting Perfect Baguette Characteristics: Crust : Golden brown, crispy, audible "singing" Crumb : Open, irregular holes Texture : Light, airy interior Flavor : Complex, slightly nutty, mild tang Shape : Even, well-defined scoring Common Problems & Solutions: Dense crumb : Under-fermented: Extend bulk fermentation Over-mixed: Reduce mixing time Insufficient steam: Improve steam generation Poor oven spring : Over-proofed: Reduce final proof time Dull blade: Use sharp razor No steam: Ensure proper steam first 15 minutes Flat loaves : Weak gluten: Improve mixing, check flour protein Over-hydrated: Reduce water slightly Poor shaping:

Practice proper technique Pale crust : Low temperature: Increase oven heat Insufficient enzymes: Add diastatic malt No steam: Steam creates glossy, colored crust Production Schedule for Bakery Day 1 (Evening): 6:00 PM: Make poolish 6:15 PM: Clean equipment Day 2 (Baking Day): 6:00 AM: Check poolish, prepare workspace 6:30 AM: Autolyse (flour + water) 7:00 AM: Final mix 7:15 AM: Start bulk fermentation 7:45 AM: First fold 8:15 AM: Second fold 8:45 AM: Third fold 11:00 AM: Pre-shape 11:30 AM: Final shape 12:30 PM: Score and bake 1:00 PM: Fresh baguettes ready Cost Control & Consistency Yield calculations: 1000g flour produces ~2.8kg finished baguettes Typical yield: 8-10 baguettes at 250g each Factor 8-10% waste for optimal costing Quality control checkpoints: Poolish : Proper fermentation indicators Dough temperature : Consistent 24-26°C Bulk fermentation : Visual and tactile cues Shaping : Uniform length and thickness Proofing : Proper timing and texture Scoring : Consistent depth and angle Baking : Color and internal temperature Professional tips: Keep detailed production logs Monitor ambient temperature and humidity Maintain consistent flour brand and protein content Practice shaping technique until muscle memory develops Invest in proper steam equipment for consistent results This formula and technique will produce authentic French baguettes that meet professional bakery standards when executed with precision and consistency.

R300 Recipes for Bakery

Reference formulation — not released for production. Source S099, full recipe document; body blocks/pages in source inventory.

Review decision: Retained source variant or collection. Compare with the named working card; do not copy old prices, capacity guarantees, oven exhaust advice or shelf-life promises. Unspecified measures and component splits stay unresolved; source butter is not automatically the owner’s workbook margarine.

Original source recipe evidence

Recipes for Bakery: Brger Buns: or a truly professional, bakery-style burger bun, the "Beautiful Burger Buns" recipe from King Arthur Baking is widely regarded as one of the best in the industry 1 . Here's a refined version of that recipe, ideal for gourmet burgers or upscale food service:

Professional Burger Buns Recipe (King Arthur Style) Ingredients (for 8 large buns): 3/4 to 1 cup (170g to 227g) warm water 2 tablespoons (28g) unsalted butter, softened 1 large egg 3 1/2 cups (418g) all-purpose flour 1/4 cup (50g) granulated sugar 1 1/4 teaspoons salt 1 tablespoon instant yeast Optional Toppings: Melted butter (for brushing) Egg white + 1 tbsp water (for seed adhesion) Sesame seeds, poppy seeds, or everything bagel mix

Instructions:

1. Make the Dough

Combine all ingredients in a mixer or by hand until a soft, smooth dough forms. Knead for 6–8 minutes (stand mixer) or 10–12 minutes by hand.

2. First Rise

Place dough in a greased bowl, cover, and let rise for 1 to 2 hours, until nearly doubled.

3. Shape the Buns

Gently deflate the dough and divide into 8 equal pieces (about 100g each). Shape each into a ball, then flatten to about 3 inches in diameter. Place on a parchment-lined baking sheet.

4. Second Rise

Cover and let rise for 45–60 minutes, until puffy.

5. Preheat & Glaze

Preheat oven to 375°F (190°C). Brush buns with melted butter. For seeded buns, brush with egg white mixture and sprinkle seeds.

6. Bake

Bake for 15–18 minutes until golden brown. Brush again with melted butter for a glossy finish.

7. Cool

Let cool on a wire rack before slicing.

These buns are soft, slightly sweet, and rich in flavor —perfect for gourmet burgers or upscale sandwiches.

Original source recipe evidence

The Premium Kumba Bread Formulation (Per 50kg Bag) Kumba bread owes its legendary status to three characteristics: pronounced sweetness, a rich buttery aroma, and a dense, pillow-soft crumb. Because you are using a 50kg spiral mixer , you can dump a whole bag of flour at once. Traditional bakers use cheap vegetable fat; to make yours "Premium" and capture the market, you will use a high-quality margarine/butter blend and a touch of milk powder. The Ingredient Blueprint High-Gluten Hard Wheat Flour: 50 kg (Provides the strong gluten network needed for a high rise). Water: 26 to 28 Liters (Adjust based on flour absorption; keep dough firm, not sticky). Granulated Sugar: 5 kg to 6 kg (This high sugar content gives Kumba bread its signature sweet profile and dark golden crust). Premium Margarine / Bakery Shortening: 2.5 kg (For the rich, melt-in-the-mouth texture). Instant Dry Yeast: 400g to 500g (Adjust down slightly during hot weather). Salt: 750g (Balances the intense sweetness). Full-Cream Milk Powder: 1 kg (The "secret" premium upgrade that improves aroma and crumb color). Bakery Improver (Crumbs/Softener): 250g (Ensures the bread stays soft for up to 5 days). Industrial Processing Steps The Mix (Spiral Mixer): Combine flour, sugar, salt, milk powder, and yeast. Add water slowly. Mix on low speed for 2 minutes. Add the margarine, shift to high speed, and mix for 8–10 minutes until the dough is completely smooth and passes the "windowpane test." Moulding (Dough Moulder): Divide the dough into your target weights (e.g., 500g or 800g pieces). Run them through your automatic dough moulder. The moulder is critical here—it tightly rolls the dough, expelling large air pockets to create the dense, uniform crumb structure Kumba bread is famous for. Baking (16-Tray Rotary Oven): Proof the dough until it doubles in size. Bake in your diesel rotary oven at 190°C to 200°C for 25–30 minutes . The rotary motion ensures every single loaf gets an even, golden-brown crust.

Original source recipe evidence

The Premium Burger Bun & Sandwich Loaf Formula For burgers and commercial sandwiches, you need a dough that is light, slightly enriched, uniform, and structurally strong enough to hold heavy fillings without collapsing or getting soggy. This recipe uses a brioche-style hybrid adjustment (using real egg/milk profiles) optimized for your 50kg industrial spiral mixer. The Ingredient Blueprint (Per 50kg Bag of Flour) High-Gluten White Flour: 50 kg Water: ~25 Liters (Keep the dough slightly firmer for buns so they hold their round shape). Granulated Sugar: 3.5 kg (Lower than Kumba bread; you want a subtle sweetness, not an overwhelming cake flavor). Premium Margarine / Unsalted Butter: 3.5 kg (Higher fat content creates a rich, pillowy texture that stops the bun from drying out). Egg Powder (or Fresh Eggs): 1 kg of egg powder / approx. 80 fresh eggs (Crucial for the classic golden interior, rich flavor, and professional crumb). Milk Powder: 1.5 kg (Improves crust browning and interior softness). Instant Dry Yeast: 500g Salt: 800g (Important to balance savory fillings like meat and mayonnaise). Bakery Improver: 300g (Gives the buns elasticity so they bounce back when squeezed). Industrial Processing Steps The Mix: Mix dry ingredients (flour, sugar, salt, milk powder, egg powder, yeast) in your spiral mixer. Add water slowly, then add the margarine. Mix on high speed for about 10–12 minutes until smooth. Moulding & Shaping: For Burger Buns: Weigh dough into uniform 80g to 100g balls. Shape them into perfect spheres. Place them on your 16-tray baking sheets, leaving enough space for expansion. Lightly flatten the top of each ball so they grow outward rather than just upward. For Sandwich Loaves: Run the dough through your automatic moulder to form logs and drop them into rectangular loaf pans. The "Premium" Finish (Glaze): Right before loading them into the oven, gently brush the tops of the burger buns with an egg wash (beaten eggs mixed with a splash of water) and sprinkle them with sesame seeds . This creates a glossy, professional, high-end look. Baking (Rotary Oven): Bake in your diesel rotary oven at 180°C to 190°C for 15–18 minutes for buns (longer for sandwich loaves). The rotary fan ensures every single bun browns perfectly evenly without burning on one side.

1. Initial equipment assessment

Baker’s request

> i an a baker currently sourcing equipment in alibaba. i live in nkambe cameroon and need to know what one equipment will make a very heavy impact and grant a fast an high roi on my invest ment, I have bought, 16 tray diesel rotary ove, 50kg sprial mixer, a baguette molder, omng other equipment and would l;ike to know if you could advise me on a very crucial machine that would make a difference in the production or in the market

AI Mode response — supplied text

The single equipment that will make the heaviest impact and grant you the fastest, highest return on investment (ROI) is an automatic dough divider rounder (or a hydraulic dough divider).

You have already invested heavily in the "heavy hitters" of output capacity: a 16-tray diesel rotary oven (which bakes massive quantities evenly), a 50kg spiral mixer (which prepares bulk dough quickly), and a baguette molder (which handles shaping). 1, 2

Currently, your biggest threat to ROI is the human bottleneck between the mixer and the molder. Weighing and dividing 50kg batches of dough by hand is slow, highly inaccurate, and creates a severe production delay while your expensive diesel oven sits idle, burning fuel.

Why a Dough Divider is Your High-ROI Machine

Eliminates the Ultimate Bottleneck: A 50kg spiral mixer creates enough dough for roughly 100–150 loaves of bread per mix. Dividing that by hand takes a team of workers 20–30 minutes. An automatic divider does it in under 30 seconds.

Drastic Cost & Waste Reduction: Manual dividing results in irregular loaf sizes. If a loaf is too small, customers complain; if it is too large, you lose profit margins. A machine guarantees exact, identical weight down to the gram, saving you thousands of CFA francs daily in wasted flour.

Maximizes Diesel Efficiency: In Nkambe, managing operational costs like diesel fuel is crucial. Your rotary oven needs to be filled to maximum capacity continuously to make the fuel cost worth it. A divider keeps up with the speed of the oven so you aren't wasting fuel on half-empty bakes.

Alternative Market-Driven Choice: A Bread Slicer

If your production workflow is already fast enough, your biggest leverage point is market value rather than production speed.

An electric commercial bread slicer is highly affordable on Alibaba but allows you to instantly enter the high-margin sliced pan-loaf (sandwich bread) market. Sliced and packaged bread sells for a premium price compared to standard local loaves, allowing you to recover the machine's cost in just a few weeks.

Production Comparison Overview

Equipment	Production Impact	Market Impact	ROI Speed
Dough Divider	Massive. Eliminates manual scaling; cuts preparation time by 90%.	Ensures perfectly uniform product weight and appearance.	Extremely Fast. Saves money immediately on labor and flour waste.
Bread Slicer	Low. Does not speed up the actual baking process.	High. Unlocks premium-priced sliced bread markets.	Fast. Driven by immediate product upcharging.

To help you choose the best model on Alibaba, tell me:

What is your primary product? (e.g., standard local loaves, baguettes, or sandwich pan-bread?)

What is your labor situation in Nkambe? (e.g., is labor expensive/hard to manage, or is your main goal expanding your product lineup?)

AlibabaIndustrial Rotary Oven diesel Bakery Oven| Alibaba.comCommercial bread bakery ovens is widely used in food industry because of its big capacity of baking. 2. Product expansion after confirming the manual divider

Baker’s request

> In fact I am having a manual dough divider that gives 36 pcs a cut, my primary products are :-standard local loaves, baguettes, and sandwich pan-bread. labor hard to manage, and my main goal is expanding your product lineup

AI Mode response — supplied text

Since you already have a 36-piece manual divider and face difficult labor management, your production floor is reasonably covered. Because your main goal is expanding your product lineup while keeping labor minimal, the machine that will give you the heaviest market impact and fastest ROI is an industrial planetary mixer (20L to 40L capacity).

Your 50kg spiral mixer is excellent, but it is a specialist machine—it can only mix heavy bread dough. It cannot whip, cream, or handle delicate pastries.

Why a Planetary Mixer is Your High-ROI Choice

Unlocks a Premium Product Lineup: A planetary mixer allows you to instantly introduce high-margin products that standard bakeries in Nkambe don't offer. You can produce cakes, pastries, queen cakes, donuts, brioche, croissants, and cookies.

The Sweet-Tooth Premium: Sweet goods and confectionery items use less flour but sell at a much higher profit margin per gram than standard local loaves.

Bypasses Labor Hardships: Pastry making by hand requires highly skilled, reliable labor (creaming butter, whipping eggs to specific peaks). A planetary mixer automates this entirely. You or a single assistant can pour in ingredients, set a timer, and get perfect results every time without relying on a large, unreliable team.

Alternative Choice: A Dough Sheeter (Laminator)

If you want your product expansion to focus strictly on premium bread variations and puff pastries rather than cakes, look into a tabletop or floor-standing dough sheeter.

What it unlocks: Croissants, meat pies, sausage rolls, Danish pastries, and layered local pastries.

Labor impact: Rolling out laminated dough by hand is physically exhausting and usually requires multiple workers. A sheeter turns this into a fast, one-person job, ensuring perfect, flaky layers every time.

Product Expansion Comparison

Equipment	New Products Unlocked	Labor Reduction Level	Market Differentiation in Nkambe
Planetary Mixer	Cakes, donuts, cookies, queen cakes, sponges, creams, and icings.	High. Automates skilled tasks like whipping and creaming.	Very High. Shifts your business from a basic bread bakery to a full-service pastry shop.
Dough Sheeter	Croissants, puff pastries, meat pies, and danishes.	High. Eliminates grueling manual rolling and dough laminating.	High. Offers premium, flaky baked goods that are rare in rural markets.

To help narrow down the exact specifications for your Alibaba order, let me know:

Which direction appeals more to your target market in Nkambe: cakes and sweet confectionery, or savory meat pies and flaky pastries?

Do you already have a commercial bread slicer to handle the sandwich pan-bread you mentioned?

3. Bread slicer recommendation after the updated equipment inventory

Baker’s request

> i am a baker currently sourcing equipment in alibaba. i live in nkambe cameroon and need to know what one equipment will make a very heavy impact and grant a fast an high roi on my invest ment, I have bought, 16 tray diesel rotary oven, a heavy duty stick blender with a head for whipping cream and mixing cakes and pastries, a I already have a manual dough divider that gives 36 pcs per cut,, 50kg sprial mixer, a baguette molder, omng other equipment and would l;ike to know if you could advise me on a very crucial machine that would make a difference in the production or in the market

AI Mode response — supplied text

Based on your updated inventory—especially since you already have a 36-piece manual divider and a heavy-duty stick blender capable of handles cakes and creams—the single most crucial machine that will grant you the fastest ROI and heaviest market impact is a commercial bread slicer.

You mentioned in your previous message that sandwich pan-bread is one of your primary products. In Cameroon's market, selling whole, unsliced pan-loaf severely limits your customer base. An electric bread slicer is a relatively low-cost investment on Alibaba, but it completely transforms your market reach and solves your labor challenges.

Why a Commercial Bread Slicer is Your High-ROI Machine

Unlocks High-Margin Retail Markets: Stores, supermarkets, schools, and busy families in and around Nkambe want the convenience of pre-sliced sandwich bread. Unsliced bread is viewed as a basic staple, whereas sliced and neatly packaged bread is a premium product that commands a higher price per loaf, instantly boosting your profit margins.

Solves the Labor Bottleneck: Slicing sandwich bread by hand with a knife is a nightmare. It is incredibly slow, dangerous, and results in uneven slices that look unprofessional. A commercial frame slicer can perfectly cut an entire loaf into uniform slices in less than 5 seconds with zero effort.

Zero Technical Labor Required: Because labor is hard to manage, you cannot rely on workers to slice bread evenly all day. A mechanical slicer requires absolutely no skill to operate—anyone can slide the loaf in, press a lever, and bag it perfectly.

The Alternative Production Choice: A Dough Sheeter

If you prefer to focus your expansion strictly on a new product lineup rather than maximizing your existing sandwich bread, a tabletop dough sheeter (laminator) is your best alternative. Since you already have a stick blender for cakes, a sheeter allows you to efficiently add meat pies, sausage rolls, croissants, and local flaky pastries to your menu without exhausting your workers by rolling dough by hand.

Final Equipment Decision Matrix

Equipment	Production Role	Market / Product Impact	Labor Solution
Commercial Bread Slicer	Packaging Speed. Slices a whole loaf perfectly in 3–5 seconds.	Massive. Elevates your sandwich pan-bread to a premium, retail-ready product.	Total. Completely eliminates slow, uneven, and hazardous manual knife slicing.
Dough Sheeter	Lineup Expansion. Rolls out pastry dough to uniform thicknesses instantly.	High. Unlocks high-margin savory pies, croissants, and flaky pastries.	High. Bypasses the grueling manual labor of rolling out stiff dough.

To help tailor the next step for your Alibaba sourcing, let me know:

Are you currently selling your sandwich pan-bread unsliced, or are you skipping it entirely because slicing by hand is too difficult?

What power setup do you have in Nkambe (e.g., standard single-phase 220V grid electricity, or do you rely completely on a generator)?

4. Sandwich bread bottleneck and the stated power setup

Baker’s request

> skipping it entirely because slicing by hand is too difficult, for power I haave a 30KW solar system with a VFD that can easily give me 3phase current anytime

AI Mode response — supplied text

Since you are skipping sandwich pan-bread entirely because manual slicing is too difficult, buying a 3-phase industrial frame bread slicer on Alibaba is an absolute goldmine for your bakery.

You already have the 50kg mixer to make the dough and the 16-tray diesel oven to bake the pan-loaves in bulk.

Right now, your existing investment is sitting idle on a highly profitable product line simply because of a slicing bottleneck. Introducing a slicer immediately unlocks a major revenue stream with zero extra ingredient or mixing costs.

Furthermore, your 30KW solar system with a VFD (Variable Frequency Drive) is a massive competitive advantage in Nkambe. You can run a heavy-duty, high-efficiency 3-phase electric slicer completely on free solar power, dodging both grid instability and expensive diesel generator fuel.

Why the Bread Slicer is Your Immediate Next Step

Instant Product Expansion with Zero Learning Curve: You don't need to train unmanageable labor on complex pastry techniques. You already know how to bake bread. You simply bake the pan-loaf, let it cool, run it through the machine, and bag it.

The "Premium Price" Advantage: Sliced sandwich bread sells at a much higher price point across Cameroon compared to standard local loaves. Because it is pre-sliced, you can cater to local shops, schools, hospitals, and civil servants in Nkambe who want convenience.

Flawless Presentation: A commercial frame slicer uses a row of perfectly spaced, vibrating blades to cut a whole loaf in under 4 seconds. The slices are perfectly uniform, which is critical for making your brand look premium and trustworthy on retail shelves.

What to Look for on Alibaba (Sourcing Specs)

When messaging suppliers on Alibaba, use your technical advantage to get the exact machine you need. Look for these specifications:

Power Configuration: Specify 3-Phase, 380V–415V, 50Hz. Since you have a VFD, a 3-phase motor will run incredibly smooth, draw less current, and last much longer than a single-phase motor.

Type: Ask for a Gravity-Fed Frame Bread Slicer (also called a bread slicing machine). Avoid expensive automatic conveyor-belt slicers unless you are doing thousands of loaves a day; a standard gravity-fed push frame is fast, durable, and easy to clean.

Slice Thickness: Standard sandwich slice thickness is usually 12mm to 15mm. Ensure the blade spacing matches what is popular in your local Cameroonian market.

If you want to move forward with the Alibaba search, I can help you with the next step:

R306 Bread fillings

OCR reference — original measures retained. Source S050, OCR PDF page 2.

Review decision: Check OCR against the image; weigh count/cup/spoon ingredients before scaling. A short cook time or microwave finish does not establish a safe burger centre. Wet fillings require C01 cooling and cold holding. H18/H19 provide two explicit filling adaptations.

Original source recipe evidence

Savory Bread Fillings Caramelized Onion & Gruyere Cheese Ideal for: Rustic sourdough, focaccia, or braided bread Ingredients:

- 2 large onions, thinly sliced

- 2 tbsp olive oil

- 1 tsp balsamic vinegar

- 150g Gruyere cheese, grated

- Salt and pepper to taste

Method:

- Saute onions in olive oil over low heat until deeply caramelized (30•40 mins).

- Add balsamic vinegar and season.

- Cool, then mix with grated Gruyere.

- Spread inside dough before shaping or folding.

Roasted Garlic & Herb Cream Cheese Ideal for: Stuffed rolls, bagels, or savory babka Ingredients:

- 1 bulb garlic

- 200g cream cheese

- I tbsp chopped chives

- I tsp thyme

- Salt to taste

Method:

- Roast garlic at 180C for 40 mins, squeeze out cloves.

- Mash into cream cheese with herbs and salt.

- Pipe or spread into dough before baking.

Sun-Dried Tomato, Olive & Feta Ideal for: Mediterranean-style bread rings or flatbreads Ingredients:

- IOOg sun-dried tomatoes, chopped

- IOOg Kalamata olives, pitted and chopped

- 150g feta cheese, crumbled

- I tbsp oregano

Method:

- Mix all ingredients.

- Use as a filling in rolled or layered dough.

R307 Bread fillings

OCR reference — original measures retained. Source S050, OCR PDF page 3.

Review decision: Check OCR against the image; weigh count/cup/spoon ingredients before scaling. A short cook time or microwave finish does not establish a safe burger centre. Wet fillings require C01 cooling and cold holding. H18/H19 provide two explicit filling adaptations.

Original source recipe evidence

Sweet Bread Fillings Hazelnut Praline & Dark Chocolate Ideal for: Brioche, croissants, or chocolate babka Ingredients:

- 100g hazelnuts, toasted

- 100g sugar

- 150g dark chocolate, chopped

- 50g butter

Method:

- Make praline: caramelize sugar, pour over hazelnuts, cool, then blitz into paste.

- Mix with melted chocolate and butter.

- Spread into dough layers or swirl into loaves.

Vanilla Bean Pastry Cream Ideal for: Danish pastries, sweet buns, or filled brioche Ingredients:

- 500m' whole milk

- I vanilla bean

- 100g sugar

- 4 egg yolks

- 40g cornstarch

- 50g butter

Method:

- Heat milk with vanilla.

- Whisk yolks, sugar, and cornstarch.

- Temper with hot milk, cook until thick.

- Stir in butter, cool, and pipe into bread.

Apple Cinnamon Compote Ideal for: Cinnamon rolls, monkey bread, or autumn loaves Ingredients:

- 3 apples, peeled and diced

- 50g brown sugar

- 1 tsp cinnamon

- I tbsp butter

- I tsp lemon juice

Method:

- Cook apples with sugar, cinnamon, butter, and lemon juice until soft.

- Cool and use as a filling.

R318 Ice cream cake assembly and component routing

Reference formulation — not released for production. Source S129, PDF pages 49–52.

Review decision: Supporting preparation preserved separately from the named flavours. Confirm quantities, component yield and household measures on the original page. Follow the commercial safety controls; no domestic storage-duration claim is adopted.

Original source recipe evidence

•

One day before: Bake the cake and cool completely. Prepare the cake base and the pan. Churn the ice cream base in your machine and transfer directly to the prepared pan. Freeze. •

The morning of: Unmold the cake, decorate, and freeze until ready to serve. •

5 minutes before: Let the cake sit at room temperature before slicing. METHOD 1.

Prepare the cake pan. Spray a cake pan that’s 8 inches in diameter and at least 3 inches deep with nonstick cooking spray. (You can also use a springform pan of the same dimensions. Wrap the outside bottom and sides of the pan tightly with aluminum foil to prevent water from seeping in during the unmolding step.) 2.

Line the pan with parchment paper. This will make it easier to get the finished cake out of the pan. Line the bottom of the cake pan with a circle of parchment or waxed paper. Then cut two strips of parchment that are 3 inches wide by 14 inches long. Line the sides of the pan with the parchment strips, overlapping them slightly. Spray a bit of nonstick spray (or dot with butter or mist with oil) where the ends overlap to help them adhere.

3.

Prepare the cake base. You will need a 1 inch high layer of cake for the base of your ice cream cake. To achieve this, take an 8-inch baked cake, place it on a flat work surface, and trim off the domed top portion with a long serrated knife to achieve a level surface. If the cake is more than 2 inches high, split it horizontally to achieve two layers. Place one of the layers in the bottom of the prepared cake pan for the base of your ice cream cake and wrap and freeze the remaining layer for another cake. 4.

Brush, drizzle, or sprinkle the inclusions of your choice over the cake base (optional). Distribute it as evenly as possible.

TIP:

If you’re using a sauce that has been refrigerated, rewarm it gently by microwaving it at half power for 1 to 2 minutes, or place the container in a pan of gently simmering water, stirring frequently until the sauce becomes more fluid. 5.

Top with ice cream. If you have just-churned, soft ice cream, transfer it directly from the machine into the cake pan. If your ice cream has been stored in the freezer, allow it to soften in the refrigerator for 20 to 30 minutes; at the same time, put the bowl of

your stand mixer, the paddle attachment, and the cake and pan in the freezer to chill while the ice cream softens. When it’s slightly softened, put the ice cream in the mixer bowl and beat on low speed just until the ice cream is malleable, about 30 seconds. (It doesn’t need to be completely smooth, just spreadable.) Transfer the ice cream to the cake pan. Use the offset spatula to nudge the ice cream all the way to the sides of the pan, filling any gaps or holes, including any space between the cake and the pan. Rap the filled cake pan sharply on the counter a few times to encourage any air bubbles to rise to the surface and smooth the top. If adding any candies or nuts, sprinkle these onto the surface of the ice cream before freezing. Put the assembled cake in the freezer as soon as it’s filled and freeze overnight.

TIP:

If you like, you can use two different flavors of ice cream. You’ll need 1 quart of each flavor, and you’ll get the best results by building the layers in stages. Add the first layer of ice cream to the prepared cake base, freeze for a few hours to solidify, then add the second layer of ice cream. Freeze the completed cake overnight as you would a single-flavor cake.

TIP:

For ice creams that contain swirled-in sauces (like the Peanut Butter Fudge Swirl , too much stirring or manipulation, including the process of building the ice cream cake, can produce muddy-looking results. If you want to use one of these

flavors in an ice cream cake, just freeze the ice cream base as instructed by the recipe and incorporate the swirl once the ice cream is in the prepared cake pan. 6.

At least 1 hour (and no more than 12 hours) before serving, unmold the cake. To release the cake from the pan, invert the cake onto a plate or cardboard round the same size or smaller than the cake pan and run the pan under warm tap water until the cake loosens. (If you are using a springform pan, be sure to wrap the seams tightly in

R319 Cookie crumb pie crust and ice cream pie assembly

Reference formulation — not released for production. Source S129, PDF pages 55–59.

Review decision: Supporting preparation preserved separately from the named flavours. Confirm quantities, component yield and household measures on the original page. Follow the commercial safety controls; no domestic storage-duration claim is adopted.

Original source recipe evidence

Cookie Crumb Piecrust

COOKIE CRUMB PIECRUST A food processor is ideal for making fine, even crumbs for this crust. 1½ cups fine cookie crumbs, from homemade or storebought cookies 2 tablespoons sugar 2 tablespoons unsalted butter, melted Pinch of kosher salt 1. Position a rack in the center of the oven and preheat the oven to 350°F. 2. In a small bowl, combine all of the ingredients until evenly blended. The mixture will be crumbly but should hold together when you pinch some between your fingers. Transfer to a 9-inch pie pan and distribute evenly along the bottom and sides of the pan. Use a drinking glass or other flat-bottomed object to press the crumbs to an even thickness. 3. Bake until the crust is light golden brown, 8 to 10 minutes. Remove from the oven and let cool completely.

ICE CREAM PIE ASSEMBLY The easiest way to make an ice cream pie is to have the baked, cooled piecrust ready to go before you churn your ice cream. That way you can transfer the finished ice cream directly from the machine into the crust. If your schedule doesn’t allow this, however, you can certainly use already-made ice cream; you’ll just need to soften it in the refrigerator and beat it in a stand mixer to get it to the optimal spreading consistency. (See step 2 .) TOOLS • 9-inch pie pan (glass, metal, or ceramic) • A stand mixer with the paddle attachment, if using already-frozen ice cream • A rubber spatula • An offset metal spatula INGREDIENTS • One baked and cooled Cookie Crumb Piecrust • ⅓ cup inclusion such as nuts, chopped candies, sauce, or cookie pieces for the piecrust (optional; see examples) • About 1 quart (1 batch) ice cream • Toppings to garnish the assembled pie (optional; see examples) TIMELINE •

Two days before: Make a batch of ice cream base and chill. Pulverize the cookies of your choice (storebought or homemade) in a food processor to make 1½ cups crumbs. Make and bake the piecrust (it can sit wrapped with plastic wrap overnight on the counter). •

The day before: Churn the ice cream and assemble the pie. Freeze overnight. •

The morning of: Decorate the pie with any desired frostings or garnishes and freeze until ready to serve. •

5 minutes before: Let the pie sit at room temperature before slicing. METHOD

1.

Spread the inclusions of your choice across the bottom of the crust (optional). Sprinkle or drizzle it as evenly as possible. 2.

Add the ice cream. If you have just-churned, soft ice cream, transfer it directly from the machine into the piecrust. If your ice cream has been stored in the freezer, allow it to soften in the refrigerator for 20 to 30 minutes; meanwhile, put the bowl of the stand mixer, the paddle attachment, and the piecrust in the freezer. Put the slightly softened ice cream in the mixing bowl and beat on low speed just until the ice cream is softened and malleable, about 30 seconds. (It doesn’t need to be completely smooth, just spreadable.) Transfer the ice cream to the piecrust.

3. Use an offset spatula to nudge the ice cream all the way to the sides of the crust, filling any gaps or holes. Rap the filled pan gently (so as not to dislodge the cookie crumb crust) on the counter a few times to encourage any air bubbles to rise to the surface and smooth the top. Top the ice cream with any candies or nuts you want to add to the pie before freezing.

• Create your own ice cream pie by choosing your

favorite piecrust, an ice cream flavor, and a topping.

ICE CREAM SANDWICH ASSEMBLY At Bi-Rite Creamery we use special silicone molds to create perfectly round “pucks” of ice cream for our ice cream sandwiches. However, you don’t have to invest in these; the instructions below will help you make professional-looking ice cream sandwiches at home using regular kitchen equipment. It’s best to assemble ice cream sandwiches a few hours before you plan to serve them; the extra time in the freezer helps them freeze into a cohesive sandwich and helps prevent the ice cream from squishing out as you eat them. TOOLS • A large rimmed baking sheet that fits in your freezer • ½ cup dry measuring cup (optional) • Small offset spatula (optional) INGREDIENTS • Baked and cooled cookies of your choice (two cookies per sandwich) • Ice cream (for 3-inch cookies, you’ll need about ½ cup of ice cream per sandwich) TIME COMMITMENT • 20 minutes to soften the ice cream • At least 2 hours to solidify the assembled ice cream sandwiches METHOD 1.

Get the cookies ready. Arrange half of the cookies upside down on a baking sheet. 2.

Prepare the ice cream and assemble. Put the ice cream in the refrigerator for 20 minutes or so to let soften slightly (set the timer!). If you’re the perfectionist type, you can get a more uniform shape by using a dry measuring cup as a mold for the ice cream. Pack the ice

cream into a ½-cup dry measuring cup, then use a small spoon to nudge the “puck” of ice cream out onto the cookie. Use a small offset spatula to even out the top and smooth the sides. Top with the remaining cookies and press gently to adhere. Or, you can get a more handmade look by simply scooping a large scoop of ice cream onto a cookie and sandwiching it with the second cookie. Press on the cookies slightly to encourage the ice cream to come all the way to the edges. 3.

Freeze the sandwiches. Put the baking sheet in the freezer and let the sandwiches harden for at least 2 hours.

TIP:

For the crispest cookies and brightest flavors, assemble the sandwiches the same day you plan to eat them. You can assemble these up to 1 week ahead of time, but the cookies will soften and the flavors will mellow the longer the sandwiches are stored. If storing for longer than 1 day, transfer the hardened sandwiches to zip-top freezer bags or individual glassine bags, being sure to squeeze out any excess air before sealing. RECETTES DE BÂTONNETS DE GLACE OPTIMISÉES (POUR 10 LITRES) I. Les Essentiels Gourmands au Lait Cette catégorie regroupe les saveurs classiques et les mélanges sophistiqués sans fruits, offrant des expériences gustatives riches et réconfortantes. Elle est spécialement conçue pour être économique tout en vous offrant des bâtonnets de glace au lait, doux, lisses et sans cristaux. Elle vous permettra de maximiser votre rentabilité pour une vente à 100 FCFA par bâtonnet. Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) Préparation de la Base Commune (pour toutes les saveurs) 1. Préparez le mélange sec et la base liquide : Dans un grand saladier, mélangez soigneusement le lait en poudre entier, le sucre en poudre et la pincée de sel. Dans votre grande marmite, versez les 9,5 litres d'eau froide. 2. Incorporez les poudres à l'eau : Versez progressivement le mélange de poudres sèches dans la marmite contenant l'eau, en remuant constamment avec un fouet pour éviter les grumeaux et obtenir une base liquide homogène. 3. Ajoutez le lait concentré et le beurre : Incorporez le lait concentré sucré et le beurre ramolli (ou margarine) à la préparation. Mélangez bien jusqu'à ce que le beurre soit complètement fondu et intégré. 4. Incorporez le stabilisateur (étape cruciale pour la texture !) : C'est l'étape la plus importante pour la douceur de vos glaces. Pour éviter les grumeaux : SALEXASYR3LL72ZB63T ○ Dans un petit bol, mélangez le stabilisateur avec une petite quantité de sucre (environ 5 cuillères à soupe) prélevée sur le total (ceci est très important pour le disperser). ○ Versez ce mélange stabilisateur-sucre dans environ 500 ml de la préparation liquide de la marmite (légèrement tiède si possible, mais le froid fonctionne aussi avec un bon mixage). ○ Mixez vigoureusement ce petit volume avec un mixeur plongeant (ou un blender puissant) pendant au moins 1 à 2 minutes jusqu'à obtenir un liquide sans grumeaux et légèrement épaissi. ○ Réincorporez ensuite ce mélange concentré de stabilisateur dans la grande marmite, en remuant énergiquement avec un grand fouet ou en utilisant le mixeur plongeant dans toute la marmite pendant 2 à 3 minutes. 5. Mixez pour homogénéiser et lisser : Pour une texture parfaitement lisse et sans aucun grain, utilisez un mixeur plongeant directement dans la marmite pendant 2 à 3 minutes. Vous pouvez aussi transférer la préparation par petites quantités dans un blender et mixez jusqu'à obtenir une consistance homogène et crémeuse. 6. Refroidissez complètement : Laissez le mélange refroidir à température ambiante, puis placez la marmite (couverte) au réfrigérateur pendant au moins 3 à 4 heures, ou idéalement toute une nuit, jusqu'à ce qu'il soit très froid. Le froid aidera à la formation d'une texture plus fine lors de la congélation. Cette étape est exigée surtout si vous n’avez pas de machine à glace et que vous utilisez plutôt votre congélateur ou surgélateur. Recette 1 : Bâtonnets de Glace au Lait Goût Chocolat Optimisé (10 Litres) Ingrédients de Base Optimisés (pour 10 Litres) ● 9,5 litres d'eau filtrée ou bouillie et refroidie ● 500g de lait en poudre entier ● 500g de lait concentré sucré ● 2,5 kg de sucre en poudre (quantité essentielle pour la texture douce et non cristalline) ● 200g de beurre non salé (ou de margarine de bonne qualité), ramolli (idéalement 300g si vous pouvez) ● 10 à 15 grammes de stabilisateur pour glace (comme la gomme xanthane, la gomme de guar, ou le CMC) (votre stabilisant clé pour une texture parfaite et une fonte lente !) ● Une pincée de sel (environ 5g, pour rehausser les saveurs) SALEXASYR3LL72ZB63T
