Qualified skill routing

This is a small routing index, not a requirement to load all skills. Resolve the active harness catalog first; user-level paths and cached plugin versions differ across machines. If a listed capability is absent, say so and use the linked project workflow rather than silently installing it. No slash command is assumed to exist.

Qualified capability	When to load	Authoritative project supplement
ECC `configure-ecc`	Native plugin health/update request	Maintenance; inspect compatible Codex executable first; do not map Claude hook modes to Codex
ECC `search-first`	Before adding an unfamiliar utility or workflow	Current code, tests and graphify nodes; preserve existing services/components
ECC `blueprint`	Multi-session/cross-domain plan	Small owned phases, verification and rollback; actual collaboration API only when authorized
ECC `security-review`	Auth, permissions, files, payment/sensitive changes	Workflow risk matrix; fresh RBAC, tenant binding, step-up, evidence/privacy and replay
ECC `verification-loop`	Meaningful implementation/release verification	Command registry and test lanes, not the generic build recipe
ECC `frontend-patterns` / `backend-patterns`	Focused implementation/review	Existing Next/React/Prisma/Better Auth architecture and installed versions
ECC `skill-stocktake`	Targeted duplication or upgrade review	Review relevant roots, record actual usage as unknown unless measured; no automatic deletion
Project `.agents/skills/ui-ux-pro-max/SKILL.md`	UI decision, review, accessibility, interaction	Design master and scoped page contract first; generic search is advisory
Project `.agents/skills/design-system/SKILL.md`	Token/component engineering	Implemented `app/globals.css`, `tailwind.config.ts` and canonical registries; existing token ownership
Project `.agents/skills/brand/SKILL.md`	Brand identity assets/approved adoption	`docs/branding/` proposal status versus current product decisions; do not run unmapped token sync
Project `.agents/skills/design/SKILL.md`	Route a design task, marketing/assets	Route product UI to master/UIUX; use discovered project-relative scripts
Project `.agents/skills/ui-styling/SKILL.md`	Implement existing UI components	Tailwind 3 baseline and current shared primitives; no implicit framework upgrade/init
AQStoqFlow domain/UIUX skills	Specific business or UI program work when installed	Project-owned services, invariants, constitution and tests remain available if global skill is missing

Two skills are named `design-system`: qualify the project version for token work and ECC's version for an optional extraction/review checklist. Do not generate competing design authorities. Duplicate Neon files in .agents/.claude remain in place until cross-harness distribution is deliberately reviewed. Different `caveman` copies are not assumed interchangeable.

Legacy trigger availability on 2026-10-07: global graphify, test-gen and enterprise-error-handling-complete paths were missing; enterprise-error-handling existed. Re-discover rather than hard-code these observations as permanent truth. Use AGENTS fallback behavior.

Select the model available in the active host; use stronger reasoning for architecture/security decisions and ordinary settings for mechanical edits. Do not copy model names or tool APIs from another provider's examples.
