Stoquify: Cameroon HRIS/payroll audit and product decisions

Date: 7 October 2026. Scope confirmed by the user: **private-sector SMEs with 10–250 employees**, Cameroon first. Monthly payroll is a provisional operating assumption, not a confirmed restriction. Research and planning only; no application, schema, plugin, production-data or deployment changes were made.

Executive assessment

Extend the existing HRIS and financial controls; complete statutory calculation and everyday operating journeys before regional rollout. Stoquify already has employee/contract data, effective organization structures, time/leave models, payroll review/approval/emission/posting transitions, payment reconciliation, immutable evidence and country-pack provenance. A new HRIS, generic rule engine or suite of additional plugins would duplicate much of that investment.

Current source does not substantiate a fully operational Cameroon payroll release. The default country pack labels CNPS as draft and IRPP as requiring expert review. CNPS provenance prevents default calculation from being treated as approved. Important formula and input-path discrepancies remain behind that boundary. Other issues affect ordinary SMEs immediately: incomplete employee discovery above 50 records, capped manager-scope lookups, time corrections not consumed by certification, future lifecycle events changing current status, and incomplete document and operator journeys.

These are source-based findings and engineering recommendations. They are not claims that current deployed customers have suffered incorrect pay, a data breach or a legal violation. No production tenant or deployed database was inspected.

Five highest-value changes

Rank	Change	Why it comes first	Measurable acceptance
1	Make Cameroon production admission depend on complete, reviewed, applicable capabilities	A published pack header and a successful partial calculation must never imply authoritative payroll. Preserve existing blockers and close partial-promotion paths before enabling more rules	A CNPS-only promotion with unresolved applicable tax cannot emit, post or release live payroll; denial has a clear reason and no financial side effect
2	Correct the contribution/tax calculation contract and use identical code in fixtures and actual runs	Different bases, disconnected YTD inputs and shared rounding assumptions create financial risk that UI improvements cannot solve	Independently reviewed golden cases execute through both the calculator and full run, including above-ceiling, multi-run, same-day and correction cases
3	Make HR input truth effective-dated and transactionally reliable	Approved attendance corrections, leave balances and future employee transitions must produce the correct certified period inputs	Correction changes the intended next snapshot, future termination leaves today intact, simultaneous leave debits cannot overspend, and frozen evidence stays immutable

Rank	Change	Why it comes first	Measurable acceptance
4	Complete the 10–250-person People and manager journeys	The directory currently reads 50 people and then searches locally; a manager target may be rejected after scope truncation	Employee 250 is searchable and reachable; authorized totals are correct; own/team/HR access remains distinct
5	Finish the statutory-output, payment and accounting evidence chain	Internal declaration drafts are not CNPS/DGI filings; a payment acknowledgement is not settlement	Every applicable component reconciles to the right authority, ledger liability, submission version and retained settlement/receipt proof

Ranking considers financial/compliance exposure, prerequisite order, user friction and reuse. Rank 4 can run alongside statutory work because it has independent files. Production admission still precedes activation. Complete supported HR workflows and rendered validation are launch requirements. For original HR records, the pilot must explicitly choose integrated secure delivery or an approved external archive with controlled retrieval/retention; metadata alone is not document custody. Statutory payslip provision still needs an accepted delivery process.

Evidence baseline and authority

- Inspected HEAD: `6f7f6741cabfdeff61989a40455d6f3ea37b33c9` plus the working tree. A scoped status check counted 337 modified tracked files; numerous untracked inherited files also exist. Do not treat this as a clean commit or stage the whole checkout.
- Current installed manifests: Next 15.5.18, React 19.2.6, TypeScript 5.8.3, Prisma 6.19.3, Better Auth 1.6.14, Tailwind 3.4.19. npm is the existing CI path; alternate lockfile parity remains unverified.
- Selected source manifest records exact-byte SHA-256 hashes of 24 inspected source/config files for later comparison; it is not a whole-repository or deployed-artifact attestation.
- Local git and `origin/main` exist; `gh auth status` reports no authenticated GitHub host. This audit uses local artifacts; no branch, PR or remote required-check change was made.
- Entry rules: WORKFLOW, skill routing, test lanes, configuration implementation status, tooling baseline, design master.
- Graphs were read before architecture conclusions: payroll action community 5; reconciliation community 73; HRIS approvals 41/55; self-service 80/114; People route 134. Current source, not graph age or counts, governs conclusions.

Preserve existing programs

Existing authority	Current interpretation	Action
July HRIS realization roadmap	Defines HRIS ownership and certified-input direction, but pending-model descriptions are older than current org/time schema	Reconcile statuses by current source; do not recreate existing models
Trust Spine register	WP0–8 marked complete for internal engineering, with historical DB evidence	Retain lifecycle and controls; replay affected proof for the current change instead of claiming national statutory approval
September payroll review, HRIS review, compliance review	Source reviews and scoped verification, not a full live release	This audit adds current, bounded findings and maps them back to the same programs

Existing authority	Current interpretation	Action
Executable blueprint	Implementation queue for this audit	One queue with dependencies and acceptance; not a replacement domain architecture

Detailed supporting evidence: payroll/code, HRIS/UX, security/verification, official legal sources. File/line references in those notes refer to the inspected working tree.

Gap register

P0 means block affected production rollout, not demonstrated exploitation. P1 means required for the supported pilot journey. P2 means subsequent consolidation/expansion. Confidence distinguishes source-confirmed behavior from runtime risk or missing acceptance.

ID	Evidence and consequence	Disposition / priority	Dependency and uncertainty
G01	`services/regulatory/country-packs/cameroon.ts:44-54` ; `payroll-control.service.ts:878,3061,4006,7568` . Published header, draft CNPS, review-required IRPP; default provenance blocks, but partial promotion can retain blocked/zero tax evidence	Retain controls; complete explicit production admission / P0	Approved applicability and live-vs-review mode; no deployed underwithholding asserted
G02	`payroll-control.service.ts:5825-5842` caps all CNPS components; fixture runner `:748-778` uses supplied bases. Occupational-risk branch conflicts with the distinct base in official decree	Correct/shared component calculation / P0 before activation	S03/S01 and qualified compensation-base review; above-ceiling full-run regression needed
G03	`payroll-control.service.ts:5843` omits supported evaluator YTD/adjustments; prior run query `:5702` excludes equal pay dates	Complete explicit tax context / P0	Reviewer-approved annual/period policy; same-day order and corrections
G04	`payroll-control.service.ts:1968,2029` binds rounding/year policy to accounting configuration	Separate statutory, ledger and payment policy / P0	Approved rounding stages and tax-year definition; no global precision rewrite
G05	`payroll-control.service.ts:5611-5632` selects ACTIVE employees and one latest ACTIVE overlapping contract	Complete period-eligible employment segments / P0 for leavers/retro	Existing readiness may reject cases; not proof every unsupported case silently calculates
G06	`payroll-control.service.ts:9418,9453,9482` has internal declaration fallback and reuses aggregate amount per future authority config	Complete per-authority component/output mapping / P0 before filing	Official templates, dates and review; adding a config key alone is insufficient
G07	`app/[locale]/(dashboard)/dashboard/people/page.tsx:37` , `services/payroll/employee.service.ts:512,578` ; local table controls see only first50	Fix authorized server pagination/search/counts / P0 for stated250 scope	Positive51/100/250 and tenant/location filters; current service cap100 also needs contract review
G08	`services/hris/org.service.ts:18,216,239,253,262` truncates relationship scope before target lookup; profile caller `employee.service.ts:136-142` passes limit1. Directory facade `:113-121` omits asOf from authorization but retains it for data projection	Fix target lookup and consistent temporal authorization / P1 security-sensitive	A second valid report may be denied; historical authority mismatch needs negative tests. No live disclosure claimed

ID	Evidence and consequence	Disposition / priority	Dependency and uncertainty
G09	`services/hris/operational-time.service.ts:517,537,931–1001` stores correction values but certification consumes original rows	Complete approved correction → new input revision / P0	Validate overtime and cross-period leave allocation too; source-traced, not live replay
G10	`services/hris/leave-balance.service.ts:97,112,127` balance read, entry and audit lack a wrapping transaction on inspected action path	Add atomicity and concurrent-debit policy / P0	Real PostgreSQL competing writes/audit-failure proof required
G11	`services/hris/lifecycle.service.ts:705,731` applies target status without waiting for future effective date	Fix scheduled/as-of state contract / P0	Assignment, auth and contract propagation; no observed access exploit
G12	`services/hris/document-evidence.service.ts:397` deliberately refuses original downloads; self-service correction not configured	Complete secure original delivery/correction request / P1	Storage, privacy/retention, scanner proof and server delivery; preserve fail-closed state
G13	Targeted caller search found profile/lifecycle/time setup/import actions without corresponding operating callers; manager screen says authority not modeled despite resolver	Connect existing controls and derive truthful capability / P1	Inventory alternative writers; narrow manager permission, not broad HR admin
G14	No separate legal-employer dimension found in inspected payroll schema; some child relations are ID-only rather than composite tenant relations	Explicit one legal employer/tenant for first release; audit FK constraints / P0 admission, P1 hardening	Proposed scope choice requires product confirmation; test DB boundaries before migrations
G15	Mandatory independent actors exist; neither commercial People packaging nor small-employer role onboarding is fully resolved	Complete role onboarding/entitlement policy / P1	External checker acceptable with scoped membership; no shared login or silent SoD bypass
G16	`metadata.hrisLifecycle`, compatibility payroll storage and 11k-line control service coexist with newer relational models	Selective migration/decomposition / P2	Characterization tests and demonstrated writer conflict first; no big-bang rewrite
G17	HRIS evidence HR-08: accrual/carry-over settings are stored, but targeted service search found no executing evaluator	Complete reviewed entitlement process / P1	Tranche05b: approved manual postings with reconciliation or tested automatic accrual; configured JSON is not earned entitlement

Additional lifecycle coverage and pilot boundaries

Area	Inspected evidence / remaining uncertainty	Disposition, pilot boundary and owned work
Cost centres	`prisma/schema.prisma:2754`, employee/lifecycle projections and `payroll-register.service.ts:1932` contain employee costCenter. `createPayrollLedgerPosting` constructs aggregate rule-based lines; no cost-centre dimension found in that inspected function	Retain employee label. Tranche09c freezes historical allocation in certified inputs and implements a reviewed accounting/report allocation if required. Until tested, pilot supports one recorded employee cost centre and aggregate ledger posting; do not market split analytical accounting

Area	Inspected evidence / remaining uncertainty	Disposition, pilot boundary and owned work
Allowances and benefits	`prisma/schema.prisma:3041,3085` provides earning/deduction/employer-charge definitions and approved effective-dated assignments; `payroll-control.service.ts:5641` consumes active overlapping assignments	Retain approved components. Tranche09a owns source-classified compensation and full-run fixtures. Existing component support does not prove every statutory benefit valuation
Recurring deductions, advances and loans	Bounded schema/service/action search found no distinct principal/disbursement/installment lifecycle. The LOAN test is a fixed deduction; `payroll-employee-balance.service.ts:1444` only admits posted correction cases. One-off consumption across ordinary/off-cycle runs remains unproven	Tranche09d requires an explicit supported-case contract. A generic deduction line must not be advertised as a loan ledger. Unsupported loan/advance cases require a reviewed external process or remain outside pilot acceptance
Notifications and operations	`payroll-control.service.ts:6889,7048,7307` emits outbox messages; `services/events/business-event-outbox.service.ts` retains attempts/locks; `services/assurance/assurance-alert-delivery.service.ts:18` checks transport readiness. Payroll-specific delivered reminders/escalations were not traced end to end	Retain outbox/alert infrastructure. Tranche14a owns payroll event-to-recipient mapping, privacy-safe content, retry/dead-letter recovery, missing-source/stale-rule/payment/filing alerts, on-call owner and manual fallback. No current delivery SLA claimed
Employee import	Existing HRIS migration pilot exposes dry-run readiness; operational-time import is separate	Tranche13c explicitly separates employee import preview/commit/replay/reconciliation from time import screens. No inferred production backfill or merge of conflicting employee identities
Statutory payslip delivery	`payslip-self-service.service.ts:36,900,947` is JSON-only and explicitly reports no approved PDF renderer. No separate production payslip renderer was found in the bounded payroll source search	Tranche11b owns template/order review, rendering and delivery/access evidence. Preserve archive features without calling them statutory delivery

These are bounded source findings and explicit coverage limitations; every applicable missing behavior must be closed or excluded by an accepted pilot operating model before release.

For G02, a synthetic contributable amount of 1,000,000 and group-A rate in the inspected pack gives 13,125 on the capped branch versus 17,500 using the uncapped base. This isolates a code discrepancy; remuneration eligibility and the complete real-employer calculation still require review. Official support is Decree 2016/072 arts. 4 and 8 in the DGI compilation, PDF pp. 611–612. Default provenance blockers must remain while this is corrected.

Requirements-to-evidence matrix

The source register provides publication/effective-date evidence and retrieval limitations. The following are software acceptance requirements, not a substitute statutory schedule. Applicable national employment/tax/social rules, OHADA accounting, regional payment requirements and employer policy are separate layers.

Requirement / source	Data and workflow contract	Test/evidence needed	Acceptance owner
R01 employer applicability / S01,S03,S05,S06	Verified employer registration/classification, one legal employer, establishments, sector/agreement and pay calendar; supported/unsupported profile	Missing/contradictory profile blocks authoritative payroll; same tenant cannot silently aggregate different legal employers	Product + local payroll reviewer
R02 national deductions and charges / S01,S03	Reviewed component catalogue, independent base/eligibility/cap/recipient policy, employee-versus-employer split	Golden boundary/negative cases through actual run; explicit not-applicable reasons, never missing-as-zero	Tax/payroll reviewer + engineer
R03 employment and benefits / S05,S06	Effective contract, amendments, salary categories, termination/leave/absence inputs; sector rules have provenance	Joiner/leaver/mid-period/retro/off-cycle cases with approved expected results; unreviewed categories blocked	HR/labour reviewer
R04 withholding/year /rounding / S01	Pinned tax calendar, compensation treatment, ordered prior runs, calculation and settlement units	Boundary amounts, same-day runs, year crossing, amendment correction and reproducible original history	Payroll reviewer
R05 time and leave / S05	Schedule/policy assignment, approved correction deltas, dated accrual/debit ledger and certified revision	Concurrent leave debit, cross-period allocation, correction certification, duplicate import/replay	HR + DB QA
R06 payslip/payment evidence / S05	Reviewed bilingual template, emitted version, own-employee access and retained delivery/payment proof	Field review against applicable order; unauthorized exports denied; disputed/failed delivery recoverable	Labour/payroll reviewer + UX
R07 declaration and settlement / S01,S04,S09	Separate authority/version/period totals; due-date source; manual or verified connector submission; acknowledgement and payment evidence	Per-authority tie-out, amended submission, pending/rejected/accepted states, partial payment/reversal	Accountant + authority-process reviewer
R08 accounting and close / S07	Component posting map, liability accounts, immutable payroll reference, close invalidation and retained evidence	Balanced postings and reconciliation; stale/revoked proof blocks close; correction does not overwrite original	Qualified accountant
R09 employee privacy / S08	Record-class inventory, least privilege, processor/storage decisions, retention/hold/purge and rights workflow	Raw content delivery authorization, revocation, redaction, legal hold and deletion evidence	Privacy/legal owner + security
R10 payment integration / S10	Regulated provider adapter, destination review, replay/authenticated callbacks, reconciliation	Sandbox or inspected fixtures distinguish acknowledgement from settlement; no fabricated live-provider proof	Payments/security owner

Unresolved legal inputs include current payslip-format order, relevant collective agreements, overtime and termination rules, deduction limits, privacy commencement/implementation details, the pilot's exemptions/classification and current authority output specifications. They block the affected release claim, not unrelated research or reversible engineering preparation.

Target architecture

```
flowchart TD
  A["Reviewed national sources + employer applicability"] --> B["Existing versioned country pack + production capability admission"]
  C["HRIS people, contracts, compensation, time and approvals"] --> D["Certified effective-period input revision"]
  B --> E["Deterministic component calculation"]
  D --> E
  E --> F["Review → approve → emit → post"]
  F --> G["Employee payslip projection"]
  F --> H["Payroll liabilities + accounting postings"]
  H --> I["Approved payment + reconciliation"]
  H --> J["Authority-specific declaration + submission evidence"]
  I --> K["Close assurance and retained proof"]
  J --> K
  L["Corrections: new linked revisions; original evidence retained"] --> D
  L --> K
```

Retain `services/regulatory/country-packs/` schemas, resolution, hashing, fixtures and review intake. Keep HRIS the logical people owner even while compatibility tables retain Payroll names. Retain the independent lifecycle and accounting posting kernel. Use narrowly extracted pure component functions only where necessary to eliminate fixture/run divergence; defer general control-service decomposition.

A country calculation contract should carry country/rule version, applicable employer profile, tax year and payroll period, input revision, compensation classifications, eligible prior runs, correction relationship, precision/rounding policy and provenance. It returns named components with base, rate/formula, employee/employer treatment, destination liability, explanation, rule reference and supported/not-applicable/blocked status. A blocked applicable component cannot become zero payable tax or an authoritative payslip.

Employer policies may select supported benefits/schedules and more favourable terms where reviewed; they cannot override statutory floors, disable mandatory charges or rewrite certified inputs. Employee facts select rules, not create ad hoc statutory exemptions. Calculation date, earned period, pay date and correction date need explicit semantics rather than one assumed date for all rules.

For the first release, recommend one legal employer per tenant, with multiple establishments if the current authority and filing model supports them. Multi-employer consolidated payroll inside a tenant is deferred until an explicit employer key and its authorization/reporting implications are designed. This is a product scope decision, not an assertion that tenant isolation alone proves legal-employer correctness.

CEMAC readiness without premature rollout

The inspected registry contains Cameroon. Reuse workflow, actor controls, calculation interface, evidence envelope, UI patterns and provider abstractions. Independently research and review every national pack. An absent pack must produce an unsupported-country result, never fall back to Cameroon.

After Cameroon pilot acceptance, shortlist Gabon and Republic of the Congo for discovery if customer demand and qualified partners support them; this is a provisional product sequence, not researched market superiority.

Keep Chad and Central African Republic in the same demand/readiness evaluation. Equatorial Guinea additionally requires explicit language and statutory-output localization discovery. No country has been nationally certified by this audit.

Choose the next country using signed pilot demand, available official texts, qualified reviewer, local employer/process knowledge, language/output readiness, provider access and test-environment availability. Weight these criteria with product leadership; do not invent country scores. Build one second-country adapter behind a disabled activation gate to prove separation before repeating it elsewhere.

Operating journeys and modern UX

Keep the existing semantic tokens, brand, dashboard primitives and permission-driven actions. The goal is reliable task completion, with visual modernization serving that goal. Proposed persistent contracts: `design-system/stoquify/pages/hris-people.md`, `hris-time.md`, `payroll-run.md`, `payroll-declarations.md`, `employee-self-service.md`. These are future implementation artifacts, not new authorities already activated by this audit.

Role / job	Proposed journey using current controls	Required truth, states and privacy
HR administrator	Employer setup → complete People directory → profile/contract/lifecycle request → independent approval → dated application	Show pending/future/current separately; profile completeness explains missing inputs; secure original documents only when delivery is implemented
Manager	Effective team → attendance/leave exceptions → scoped decision → confirmation	No broad HR permission to unblock a button; no salary/bank fields; explain expired delegation and out-of-scope records
Payroll preparer	Period readiness → fix sources → calculate review-only/authoritative preview → reconcile variances → submit	Show rule and input revision; distinguish unknown, zero, blocked and not applicable; stable employee totals across pages
Approver	Review change summary, exceptions, component totals and sources → step-up → approve current version	Material changes invalidate review; own preparation and stale version denied; no fabricated completion badge
Accountant/releaser	Post → reviewed payment destination → release → reconcile → authority declaration → close proof	Partial/uncertain payment, rejected filing and stale close proof have clear recovery; exported file does not imply accepted submission
Employee	Secure own profile/payslip → request correction → status/history	No direct edits to approved payroll truth; bilingual readable documents; denied/unlinked/archived states; shared-device download guidance

French and English labels, errors and exports must be meaningfully reviewed, not merely present as translation keys. Use locale-aware navigation, tabular monetary alignment and explicit period/currency. Keep error summaries focusable, associate field errors, return focus after dialogs, and announce asynchronous results without exposing salary in global notifications. Verify keyboard, touch, zoom and small-screen task completion with rendered evidence.

Connectivity: allow recoverable non-sensitive drafts and idempotent import staging where appropriate. Avoid caching payslips, bank details or national identifiers in a generic offline store. Approval, payroll posting and payment release require fresh server state. When a response is lost, look up the retained command result before retrying; never invite a second disbursement.

Operational discovery must confirm employee device access, literacy/language, bank/mobile-money/cash use, staffing for independent checks, imported data quality and establishment geography. Existing go-to-market

prospects are hypotheses, not confirmed customer conditions. Do not introduce facial recognition, biometric attendance, broad surveillance or an AI payroll decision-maker as a prerequisite.

Durable ECC and UI/UX Pro Max operating plan

Observed problem	Capability and persistent project adjustment	Owner / maintenance	Measure of benefit
Old plans describe models now implemented	ECC search-first + blueprint; reconcile existing status register with code/test/source references	Engineering lead per tranche	Fewer duplicated changes; every planned gap has a current source anchor
Fixture and run calculations diverge	ECC testing/verification guidance; shared calculator fixtures and requirement-to-test map	Payroll engineer + independent reviewer on each rule change	Reviewed golden cases agree in both paths; no missing applicable component
Authorization and lifecycle changes are high-risk	ECC security review with scoped denial matrix and transaction proof	Security/domain reviewer per affected PR	Cross-tenant/SoD/revocation cases passed by class; stale evidence clearly flagged
Generic commands can mutate databases	Existing command registry/test lanes; add inspected HRIS/payroll lane only after review	QA/platform per runner/config change	No inferred production target; skipped DB suites never counted as passes
Page contracts cover other modules, not these jobs	UIUX focused research plus HRIS/payroll page contracts and existing primitives	Design owner per workflow change	Task success, keyboard completion, error recovery and EN/FR parity
Statutory evidence can become stale	Source/version/effective-date ledger linked to fixtures and review intake	Qualified jurisdiction owner when law changes and before release	Every active rule has reproducible provenance and current approval
Tools can fail independently of the product	Existing maintenance and host recovery procedures; no mandatory new hook	Tooling owner on upgrades	Same task standards remain discoverable without plugin availability

UIUX queries in this audit returned useful focusable-error-summary advice; other dialog/React-pagination matches were irrelevant or absent and were rejected. No generated palette or framework-upgrade recommendation was adopted. No new dependency/package registry search was needed because this audit recommends extending existing code, not installing a new engine. Public legal web research, local graph/code/skill discovery and local Git were used; authenticated GitHub and live connectors were not established.

For the first three real tasks, record accepted tool-assisted findings, rejected suggestions, rework, time spent and user task failures against a stated baseline. Do not claim a productivity percentage from test counts. Keep advice selective; the tools do not replace qualified statutory review or authority acknowledgement.

Acceptance and release evidence

Gate	Required evidence	Current status
Country applicability and golden calculation	Independent source/formula review, boundary and exemption matrix through actual run	OPEN; source research and discrepancies documented

Gate	Required evidence	Current status
Current unit/action behavior	Inspected bounded tests, named assertions and source identity	PASS for 3 suites / 17 existing mocked tests in this audit only; not the new regression cases
HR correctness and concurrency	Approved correction certification, future lifecycle, 250-person scope, concurrent leave, failed-audit rollback	OPEN; source findings need implementation/replay
PostgreSQL authority/immutability	Real cross-tenant persistence, competing transitions, replay, audit rollback and correction evidence	NOT RUN; prior engineering proof is historical
Payment/declaration/accounting	Component totals → liabilities → settlement → authority receipts → current close proof	NOT RUN end to end; existing modules retained
Migration/import/backfill	Explicit disposable target, dry run, mapping/duplicate review, idempotency, reconciliation and restore proof	NOT RUN; dry-run readiness is not import execution
Browser/accessibility	FR/EN role journeys, denied/blocked/partial states, 360/768/1280px, keyboard and screen-reader review	NOT RUN; inherited browser connectivity limitation remains
Privacy and recovery	Approved retention/hold policy, protected raw delivery, revocation, restore/export and incident runbook	OPEN
Operational alerting and support	Authorized recipients, delivered notices, retries/dead-letter recovery, payroll-day owner and manual escalation	NOT VERIFIED end to end; existing outbox and transports are retained; tranche14a owns acceptance
Performance	Representative 10/50/250-employee synthetic datasets and agreed concurrency	NOT BENCHMARKED. Proposed pilot targets: directory API p95 <1s; 250-person calculation <60s on specified environment, subject to measurement and product approval
Remote delivery	Clean-checkout CI and required checks bound to proposed commit	NOT RUN; gh unauthenticated
Local professional and employer acceptance	Qualified Cameroon payroll/accounting/labour review plus employer parallel-run reconciliation	NOT OBTAINED; required before authoritative pilot release

Exact newly executed command and tests are in the security note. Prior configuration work's 123 pilot tests and 25 Python tests remain historical to that task; they were not silently counted as this audit's payroll certification. Hook trust/execution and remote CI remain distinct from installed/enabled ECC.

Recommend at least two employer-observed monthly cycles plus a correction/off-cycle exercise before widening rollout; this is a proposed quality gate, not a statutory minimum. Capture discrepancy resolution rather than a blanket percentage tolerance on statutory amounts. Any unexplained financial difference blocks expansion.

Decision log and unresolved questions

Decision	Status / consequence
Cameroon private-sector SMEs10–250	CONFIRMED by user during audit

Decision	Status / consequence
Monthly payroll first	PROVISIONAL; confirm pay cycles, workforce arrangements and sectors with pilot employer
One legal employer per tenant	RECOMMENDED first-release boundary; product confirmation required before implementation admission rules
Preserve HRIS logical ownership and financial kernel	RECOMMENDED based on substantial current source; no greenfield replacement
Manual validated statutory submission before API integration	RECOMMENDED when current official integration specs are unavailable; preserve receipts and version evidence
Full applicable statutory coverage before authoritative outputs	REQUIRED design invariant; define explicitly for emission/post/payment and affected declarations
Independent actors	RETAIN current controls; confirm actual staff/external reviewer assignments, no silent small-team exception
Privacy and sector agreements	OPEN professional evidence; do not fabricate certainty from source titles
Country expansion order	DEFER final choice until demand/partner/source readiness evidence exists
Platform-wide compliance claim	NOT SUPPORTED by this audit; use precise employer/period/capability scope

The blueprint contains work-package dependencies, affected files, estimates, acceptance and rollback, and a complete first execution prompt. Implementation should begin with production-scope decisions and the bounded admission contract, while independently scoped directory work can follow without waiting for every legal research item.

Independent plan review

An independent adversarial reviewer checked the requested deliverables, source qualifications and execution dependencies. Review prompted explicit ownership for leave entitlement execution, statutory payslip provision, cost-centre history, deductions/loans and delivered operational alerts. The revised plan also moves disposable database preparation before transactional acceptance, separates missing backend work from UI estimates, and permits a controlled external HR archive only as an explicit pilot decision. These corrections are incorporated; this is engineering plan review, not Cameroon professional or employer sign-off.

Closure review found no remaining high-priority omission or dependency cycle. Its two final wording corrections—05b as an explicit prerequisite for10, and the external-archive alternative for12a—were applied. Final artifact checks resolved all27 relative links across7 Markdown documents and matched all24 selected source hashes. These checks validate handoff consistency, not application behavior.
