Stoquify Dependency and Ownership Map — 2026-07-28

Order	Workstream	Authoritative owner	Depends on	Blocks
0	Containment	Domain service owners	Current audit evidence	Further exposure
1	Tenant DB boundary	Platform/security	Approved ADR and migration plan	Every tenant-owned workflow
2	Authorization/entitlement	Security/modules	Tenant boundary	External mutations and UI parity
3	Critical audit/identity	Security/users	Tenant boundary, outbox contract	Security certification
4	PO/AP controls	Purchase-order/purchasing	Authorization	AP settlement and reporting
5	POS/store credit/provider	POS/payments	Tenant/auth, schema plan	Reconciliation and cash reporting
6	Inventory integrity	Inventory	Tenant/auth, business-event contract	Valuation and close
7	Reconciliation/accounting	Payments/reconciliation/accounting	POS/AP/inventory facts	Close and financial reports
8	Payroll/compliance	HRIS/payroll/regulatory	Tenant/auth, accounting truth	Statutory close
9	Projection convergence	Dashboard/snapshots	Approved domain semantics	UI consolidation
10	Assurance/release	Assurance/operations	All preceding verified gates	Production recommendation

Shared contracts requiring single ownership

- Organization-scoped data access: platform security.
- Permission and entitlement taxonomy: security/modules.
- Business-event identity and payload hash: events platform.
- Payment state and settlement meaning: payments/reconciliation.
- Cash/AR/refund semantics: accounting/reconciliation.
- Evidence/freshness/redaction envelope: snapshots/assurance.
- Country-pack authority status: regulatory with independent expert approval.

Change isolation

Parallel agents must own distinct files. Shared schema, permission enums, event contracts, snapshot contracts and accounting semantics require orchestrator review before modification. UI work cannot define business states that do not exist in service contracts.

Stop dependencies

- No DB-scoping implementation without a compatibility and rollback plan.
- No store-credit ledger/provider lifecycle without schema and reconciliation design.
- No dashboard migration before the semantic catalog is approved.
- No statutory or production readiness claim without external evidence.
