Stoquify Verification Ledger — 2026-08-03

Safety decision

The audit inspected each candidate gate for writes, database access, network access, subprocess execution, and output defaults. `service-boundary-gate.js`, `hard-delete-gate.js`, `raw-error-boundary-gate.js`, and `workflow-assurance-release-gate.js` can write when `--out` / `--json-out` is supplied; the package invocations used here leave those arguments unset. No prior report was overwritten.

Selected Jest suites mock Prisma/provider boundaries. The migration-gate suite writes only synthetic fixtures under the OS temporary directory and injects its command runner; it does not execute a real migration.

Environment

Field	Value
Workspace	`E:\ohada saas\Focused projects\stoquify`
Branch	`codex/service-boundary-burndown`
Commit	`5dc78f2c007c51e151342de08be34b72994839bb`
Worktree	329 tracked changes; 1,232 untracked entries
Date	2026-08-03
Database/provider/browser	Not accessed

Command ledger

Command	Duration	Result	Evidence	Repository mutation
`git status --short --branch`	9.5s	PASS	Branch and 1,561 status entries observed; output was truncated in console but summarized separately	No
`git diff --stat`	13.5s	TIMEOUT	Large dirty tree and line-ending warnings; no complete stat produced	No
source/category `rg` inventories	7–29s each	PASS	Counts recorded in audit/registry	No
`npm run prisma:validate`	66.2s	PASS	Prisma config loaded; `prisma/schema.prisma` valid	No repository report output
`npm run typecheck`	229.3s	PASS	`tsc --noEmit --pretty false`, exit 0	No
`npm run lint`	303.5s	PASS with warnings	0 errors, 4 warnings	No
`npm run service:boundary:fail`	17.4s	PASS	0 active violations; 13 allowed; 13 scanned	No output args; no report write

Command	Duration	Result	Evidence	Repository mutation
`npm run hard-delete:fail`	19.6s	PASS	0 active unsafe deletes; 8 allowed; 8 scanned	No output args; no report write
`npm run error:boundary:fail`	20.6s	**FAIL**	6 active findings; 106 allowed; 112 scanned	No output args; no report write
`npm run workflow:assurance:release-gate`	16.4s	PASS (static)	38/38 checks; 11/11 indexes; 2/2 engine health; 0 static blockers	No output args; no runtime checks
focused access/control Jest slice	235.2s wrapper; 91.9s Jest	PASS	4 suites, 31 tests	No; worker force-exit warning
focused consistency/cache Jest slice	239.3s wrapper; 103.5s Jest	PASS	5 suites, 52 tests	No; worker force-exit warning
focused failure/recovery Jest slice	232.6s wrapper; 89.7s Jest	PASS	8 suites, 45 tests	Temp fixtures only
focused financial-truth Jest slice	186.2s wrapper; 56.6s Jest	PASS	7 suites, 52 tests	No; worker force-exit warning

Focused test evidence

Access, cross-tenant guard, entitlement, and maker-checker

```
services/_shared/__tests__/protect.test.ts
services/modules/__tests__/module-entitlement.service.test.ts
services/purchase-order/__tests__/purchase-order.service.test.ts
actions/purchaseOrderWorkflow/__tests__/purchaseOrderSystemAction.test.ts
```

Result: 4/4 suites and 31/31 tests passed. This proves the selected mocked guard and purchase-order contracts, including the current bulk-approval containment. It does not prove persistence-level tenant isolation or simultaneous database approval behavior.

Duplicate delivery, idempotency, offline replay, query invalidation, and POS

```
services/events/__tests__/business-event.service.test.ts
services/pos/__tests__/offline-sync.service.test.ts
hooks/__tests__/useRecentPurchaseOrderQueries.boundary.test.tsx
hooks/posHooks/__tests__/usePosOperations-receipts.test.tsx
services/pos/__tests__/pos.service.test.ts
```

Result: 5/5 suites and 52/52 tests passed. This supports selected event/offline/POS/query contracts. It does not prove original-actor replay authority, organization-switch cache clearing, provider finality, or real balance

concurrency.

Provider failure, worker lease, backfill, redaction/export, migration, and error recovery

```
services/payroll/__tests__/payroll-provider-inbox-settlement-worker.service.test.ts
services/payroll/__tests__/payroll-proof-backfill-executor.service.test.ts
services/payments/__tests__/provider-event.service.test.ts
services/communication/__tests__/whatsapp-receipt-worker.service.test.ts
services/security/__tests__/redaction-policy.service.test.ts
services/security/__tests__/export-safety.service.test.ts
scripts/__tests__/prisma-production-migration-gate.test.js
lib/error-handling/__tests__/canonical.test.ts
```

Result: 8/8 suites and 45/45 tests passed. These are mocked/pure/temp-fixture tests, not external provider, production migration, or production privacy evidence.

Payment truth, reconciliation, AP, and close

```
services/finance/__tests__/finance-dashboard.service.test.ts
services/snapshots/__tests__/tenant-operating-snapshot.service.test.ts
services/dashboard/__tests__/dashboard-read-model.service.test.ts
services/payments/__tests__/payment-reconciliation-workbench.service.test.ts
services/reconciliation/__tests__/payment-suspense-workflow.service.test.ts
services/purchasing/__tests__/ap-control.service.test.ts
services/accounting/__tests__/data-trust.service.test.ts
```

Result: 7/7 suites and 52/52 tests passed. Independent suite passes do not resolve the cross-service status-semantic contradiction or capped aggregate finding because no shared truth-table/large-tenant contract is asserted.

Lint warnings

1. `components/dashboard/items/ModernItemFormForEditing.tsx:514` — raw `<img>`.
2. `components/frontend/custom-carousel.tsx:62` — raw `<img>`.
3. `components/ui/groups/inventory/ItemManagement.tsx:173` — raw `<img>`.
4. `config/permissions.ts:581` — anonymous default export.

These are P3/P2 hygiene/performance issues and were not modified.

Raw-error gate findings

File	Line	Classification
`services/accounting/accountant-access.service.ts`	282	needs canonical mapper/reviewed rethrow classification

File	Line	Classification
`services/accounting/close-assurance.service.ts`	3245	needs canonical mapper/reviewed rethrow classification
`services/agents/portfolio/connector-inventory-read-model.service.ts`	358	raw domain error
same	362	raw domain error
same	366	raw domain error
same	370	raw domain error

Test-process warning

Access/control, consistency/cache, and financial-truth invocations all passed their assertions but emitted:

> A worker process has failed to exit gracefully and has been force exited.

This indicates timer/handle teardown debt. A narrowed `--detectOpenHandles` diagnostic is safe in principle, but was not run because it can significantly extend execution and does not change the audit's principal correctness verdict. It is recorded as `TEST-001`.

Skipped, blocked, and unverified checks

Check	Status	Reason	Required prerequisite
`npm run policy:gates`	SKIPPED	Composite includes report writes and runtime/environment-sensitive checks	Clean candidate; inspect every subcommand; authorize new output paths
`npm run verify:repo`	SKIPPED	Invokes policy composite and full suite/build	Clean candidate and artifact authority
`npm run verify:ci`	SKIPPED	Migration deploy/status and full verification	Disposable named CI database and migration authority
`npm run verify:release`	SKIPPED	Release secrets/evidence/provider/environment effects	Named release environment and independent approval
Prisma migrate deploy/status/reset	BLOCKED	Unidentified/no disposable database; reset is destructive	Isolated production-shaped DB, backup/rollback plan
Seeds	BLOCKED	Mutates database and may overwrite fixtures	Disposable test DB and explicit seed plan
`*.postgres.test.ts`	BLOCKED	Requires isolated PostgreSQL and can mutate state	Dedicated database/container and cleanup ownership
Payroll immutability runtime	BLOCKED	Creates/uses test DB/runtime evidence	Dedicated disposable DB and artifact path
Authenticated Playwright/browser flows	UNVERIFIED	Setup may migrate/seed and create screenshots/artifacts	Reusable isolated auth fixture; approved artifact directory

Check	Status	Reason	Required prerequisite
Webhook/provider/authority calls	UNVERIFIED	External side effects/credentials/contracts unavailable	Mock server or sandbox provider with written authority
Real balance/approval/AP concurrency	UNVERIFIED	Mocked tests cannot prove database race behavior	Disposable PostgreSQL and deterministic concurrent harness
Organization-switch cache proof	UNVERIFIED	Requires authenticated multi-org browser fixture	Safe multi-org fixture and browser test
Audit-sink outage during transaction	UNVERIFIED	Failure policy not yet defined; requires isolated DB/outbox	Approved fail-closed/deferred policy and fixture
Load/DoS/credential attacks	BLOCKED	Potentially disruptive and outside audit authorization	Written target/scope/rate/rollback authorization
SAST/SCA/secret/SBOM/container/DAST	UNVERIFIED	Tooling/network/artifact policy not configured	Approved tools, network access, immutable output location
Backup/PITR/restore/rollback drill	BLOCKED	Infrastructure unavailable	Named environment, recovery objectives, operations owner
Statutory/OHADA certification	BLOCKED	Source hashes/expert approval/authority proof incomplete	Licensed expert and authoritative sources

Overall verification interpretation

The source compiles, lints without errors, validates its Prisma schema, preserves the configured service/hard-delete boundaries, and passes 180 focused tests. The raw-error gate fails. More importantly, none of these results proves production tenant isolation, provider settlement, real concurrency, alert delivery, migration history, recovery, user adoption, or statutory correctness. Those remain explicitly blocked or unverified.
