Stoquify platform correctness assessment

Verdict: substantial operational foundation, but not yet demonstrated as a complete, reliable offline and professional accounting/payroll platform. The schema can represent most requested business facts. The important gaps are preserving those facts through currency conversion, corrections, offline recovery and complete close, plus qualified country/provider and deployed-operation evidence.

Audit: 30 September 2026. Baseline commit: 62a56036a5ac9b37236a20c9b148052199069479. The initial working tree already had 129 modified and 1,240 untracked entries; findings concern that captured working tree, not the commit alone. Only this audit directory was authored by this audit. Concurrent work changed 15 source/test files; those changes were preserved and affected tests rechecked. See final source-fingerprint verification in evidence-index.md.

What the evidence supports today

Stoquify has meaningful source-owned services for online POS, stock movements and valuation, purchasing/AP, payment evidence, reconciliation, HRIS and payroll. Transactions, idempotency, locks, approval separation, evidence hashes, immutable payroll snapshots and read-model provenance are implemented in many critical paths.

The **strongest demonstrated local evidence** is for online POS/stock/accounting-source infrastructure and tenant-scoped service behavior. All 541 stock-level quantities agree with recorded physical movements; sampled reserved/available/value arithmetic and tenant joins passed. The commerce and platform unit cohorts passed. These results support continued controlled development/piloting, not an unconditional production release declaration.

The inferred primary customer is a Cameroon/OHADA-context small or medium business operating sales, stock, cash, purchasing and people across locations, with owner/manager, cashier, inventory, procurement, finance/accountant, HR/payroll and employee personas. This inference comes from current services, role/module contracts, EN/FR surfaces and the CM country registry. A validated segment-specific requirements/acceptance dossier was not supplied. Organization/location support must not be conflated with legal-entity consolidation, and schema currency fields do not establish correct multi-currency accounting.

What prevents a complete-platform claim

1. **Accounting correctness:** foreign-currency entries can store incorrect base amounts; reports can combine nominal currencies and still report a balanced result (F01). Locked accounting currency remains mutable (F07).
2. **Correction consistency:** generic reversal can reverse a POS journal without the corresponding business transaction (F02).
3. **Offline sales:** concurrent enqueue can lose a sale, in-flight events can become stranded after restart, and replay is deliberately test-authorized only (F03–F05).
4. **Professional close:** a period can become CLOSED despite a broader assurance blocker; general-ledger opening balance and partial fiscal-year generation also need correction (F06, F08, F09).
5. **Statutory and external readiness:** Cameroon CNPS is draft, IRPP and e-invoicing require expert review; live payment/authority acceptance and deployed operations were not proved (F11).

6. **BI completeness:** operational reports have useful provenance, but complete connected financial metrics, cash-flow reporting and several decision-support capabilities remain partial (F12).

Evidence strength

Evidence	Result	Practical limit
Schema inventory	211 models; all local model tables/column names present	Full type/index/privilege drift and production metadata not certified.
Migration history	87/87 local checksums match applied migrations	Fresh replay and populated upgrade were not performed.
Initial unit/service/component/action sweep	**3173 passed, 23 failed across 326 suites**	Audit-specific runner; mocks do not prove database concurrency or external success.
Structural gates	8 passed, 2 blocked	Text/structure evidence only.
Current-source probes	7 accounting behaviors and 3 offline conditions reproduced	Synthetic doubles/storage, no live financial mutation.
Local aggregate data	Stock and sampled arithmetic/tenant checks passed	AP/payroll/reconciliation samples are all DRAFT; final lifecycle denominator is zero.
TypeScript and browser	Typecheck timed out; app URL refused connection	No current full build/typecheck, authenticated browser or accessibility certification.

A zero mismatch on draft fixtures is not a finalized workflow pass. Similarly, no evidence of an exploit is not a security certificate. The audit explicitly separates implementation defects, intentional capability restrictions, scanner/test drift and missing release evidence.

Business decision and next work

First stabilize offline facts and financial meaning: F01–F04 and F07. Make source-owner correction and close contracts consistent next, including fiscal/calendar and report corrections. Then exercise all final lifecycles in a disposable PostgreSQL/browser environment and qualify the explicitly supported country/provider versions. Build additional BI only on those corrected sources.

Dependency-ordered remediation roadmap gives owners, acceptance evidence and migration implications. Detailed findings contains concrete repro scenarios and source links. BI capability matrix separates essential completions from later additions.

Deliverables

- findings.md and verification-summary.md.
- schema-assessment.md, schema-model-inventory.csv and model-ownership-register.csv.
- capability-coverage.csv and review-lens-register.md.
- architecture-and-workflows.md and bi-capability-matrix.md.
- remediation-roadmap.md and evidence-index.md.

This audit does not grant legal, tax, accounting, privacy, security, accessibility or production-release certification.

Later worktree changes

Recheck cohort	Suites	Passed	Failed	Source files changed during run
people	73	552	15	0
finance	65	677	3	0
supplement	16	112	0	0
changed-ui	1	8	0	0

These rechecks followed concurrent payroll/accountant-workspace edits. They overlap the initial sweep and are reported separately. Source-window and recheck details. The core offline/accounting reproduction files remained unchanged: yes.
