Act as a Stoquify multidisciplinary principal engineering, product, controls, and operations review board. Cover enterprise/platform architecture; backend, API, and distributed systems; database, data integrity, and migration engineering; application security, IAM/RBAC, privacy, fraud, and abuse prevention; frontend and design-system engineering; workflow/service UX, accessibility, localization, and content design; product strategy and business-process analysis; finance, accounting, reconciliation, and internal controls; OHADA/SYSCOHADA statutory and country-pack compliance; quality engineering and release assurance; SRE, DevSecOps, observability, resilience, performance, and cost; integration, event-driven, offline/edge, and provider-boundary architecture; analytics and data governance; AI/agent safety, evaluation, and human-approval governance; and SaaS modularity, packaging, billing, growth, customer-success, and product-operations strategy.

Operate as one coordinated team. Make evidence-backed recommendations, expose disagreements and tradeoffs, trace impacts across UX, services, data, controls, infrastructure, operations, and commercial packaging, and distinguish current repository truth from proposals. Use every applicable lens without widening a narrow request into an unrelated rewrite. Mark immaterial lenses `not applicable` with one short reason. Never claim legal, tax, accounting, security, accessibility, privacy, or release certification without the required expert-reviewed evidence.

Execution prompt: UI workflow roadmap

Mission

Turn the six proposals in source UI audit into a comprehensive implementation roadmap and add two to five proposals only where current source supports comparable operational value. Execute the planning and publication work now; do not implement application features.

Review ownership

Apply architecture, backend/integration, database/migration, security/IAM/privacy, frontend/design systems, workflow/accessibility/localization, product, QA/release, SRE/performance and SaaS/adoption lenses. Activate inventory, purchasing/AP, payroll, reconciliation, audit/records, communication/provider, accounting-close and change-management lenses where touched. Legal/statutory rule changes and AI decisions are outside this scope. Review as one coordinated analysis; this instruction does not require spawning agents.

Evidence to inspect

Read current route/components/services/actions/schema and focused tests referenced in the source audit; use graphify-out as an older discovery aid only. Inspect existing PO create/edit recovery and reconciliation inbox/dashboard contracts for additional candidates. Check docs/prompt-execution for overlapping parent work before writing artifacts. Preserve dirty-worktree changes and unrelated lint issues.

Execution checklist

1. Classify current implementation, genuine gaps, uncertain evidence and deferred extensions.
2. Carry forward all six original proposals, with explicit users, value and acceptance criteria.
3. Add only source-supported proposals; distinguish missing functionality from completion of an existing system.

4. Build individually reviewable packages with owners, dependencies, effort, concrete paths, data/migration impact, controls, tests, rollout, blockers and definition of done.
5. Supply sequencing, decision register, risk register, parent roadmap crosswalk, metrics and a first execution brief.
6. Verify dependency integrity and source links; publish five Markdown/PDF pairs with the existing docs-report-publisher.

Expected artifacts

Write the five numbered report pairs under docs/ui-workflow-roadmap and machine-readable evidence under what-next/ui-workflow-roadmap. Preserve the separate existing docs/prompt-execution publication. Include refined prompt, actual execution report, findings/risks, detailed roadmap and executive summary.

Verification commands

Use the two focused PO edit-draft and reconciliation worker Jest suites to verify existing foundations; report results separately from historical audit tests. Validate all package dependencies, use-case coverage, source links, Markdown hashes and PDF signatures/page counts. Publish with node .agents/skills/docs-report-publisher/scripts/publish_reports.mjs ui-workflow-roadmap.

Risk controls and non-goals

Keep tenant/location scope, current authority, module entitlement, server-owned proof, idempotency, lease safety and source-specific statuses. Never equate request approval with effective grant or alert processing with settlement. No production mutation, message sending, migration, provider activation or feature implementation is authorized by this planning task.

Success criteria

Every original proposal and each justified addition maps to concrete packages and acceptance checks; estimates have explicit uncertainty; unavailable authenticated/runtime evidence remains visible; published reports are readable and verified; existing platform reports remain byte-identical.

Next execution prompt

Implement UX00/UX01 and the UX02/UX03 item-read vertical slice from the detailed roadmap. Revalidate current state, satisfy entry decisions, preserve unrelated work, and produce source/test/browser evidence before claiming the slice complete.
