Roadmap planning execution report

4 October 2026 | Planning baseline: working files at HEAD 62a56036a5ac9b37236a20c9b148052199069479 plus existing local changes

What was executed

Produced an eight-proposal, 20-package implementation plan from the source UI audit. Preserved all six recommendations and added two evidence-supported completion proposals. Applied the prompt-architect, roadmap-publisher and docs-report-publisher workflow. Used the new docs/ui-workflow-roadmap destination because the normal folder already holds a separate platform roadmap.

Inspected the original audit/evidence, current PO create/edit flow and service boundary, reconciliation dashboard/inbox worker contracts, older discovery reports/graphs, existing parent roadmap headings and publication scripts. Graph node finance_paymentreconciliationworkbench_tsx (community 13) was a navigation aid; current source determined the finding. A few guessed filenames were corrected through discovery; a missing guessed path was not treated as proof of missing functionality.

Additional source findings

- ModernCreatePurchaseOrderForm stores authoring in React/form state. ModernEditPurchaseOrderForm separately restores scoped session drafts and retains pending requests. The inspected create action/service does not expose an equivalent stable create-request recovery contract. This supports UC07 without claiming that PO editing lacks recovery or that duplicates have occurred.
- The reconciliation worker tracks attempts, nextAttemptAt, last safe error and leases. The dashboard queue selects a reduced record projection and maps payload.status; DurableNotificationInbox does not expose those processing diagnostics. Worker DTOs include leaseToken and must not be passed wholesale to the browser. This supports UC08 without claiming the durable inbox is absent.

Checks actually run

```
node node_modules/jest/bin/jest.js --runInBand --runTestsByPath services/payments/__tests__/payment-reconciliation-inbox-worker.service.test.ts components/purchase-orders/__tests__/purchase-order-edit-draft.test.ts
```

Result: 2 suites, 13 tests passed; exit code 0. These tests cover existing foundation behavior with test doubles/pure logic. They do not exercise the proposed new PO authoring persistence or alert operator command. The original audit's 79 passes are historical evidence, not newly run tests or a combined 92-test run.

No application implementation, full typecheck/lint/build, live database migration, provider action, authenticated browser journey or production deployment was performed. Skills were consumed, not edited; skill-creation validation is not applicable.

Deliverables and publication evidence

The five numbered Markdown documents and their matching PDFs live in docs/ui-workflow-roadmap. The registry contains 20 full contracts and eight use-case mappings. Publication validation is recorded in publication validation; consult that manifest for actual output checks rather than treating this description as a test result. Preserved-publication hashes record the unrelated ten files in docs/prompt-execution.

Windows denied an initial parent-directory creation through apply_patch before any file was written. Narrowly escalated directory creation succeeded. Publication uses the existing local Markdown-to-PDF renderer, not a replacement toolchain.

Limitations

The originating audit scanned 163 page entries including 144 dashboard entries, but protected runtime inspection was unavailable. The present work adds targeted source analysis and planning, not an exhaustive visual reassessment. Effort, ranking and proposed metrics remain estimates until UX00/UX01. The runtime has not been independently tied to the inspected working tree. No legal, accounting, security, privacy, accessibility or release certification is claimed.
