Execution Report

Execution date: 12 September 2026

Workspace: `E:\ohada saas\Focused projects\stoquify`

Requested change: Rename the proposed skill to `stoquify-prompt-execution-roadmap-publisher` and publish the required report pairs under `docs/prompt-execution/`.

Actions completed

- Read the `skill-creator` guidance.
- Read the existing `docs-report-publisher` guidance.
- Inspected `.agents/skills/` and confirmed the old renamed skill was not present.
- Created `.agents/skills/stoquify-prompt-execution-roadmap-publisher/SKILL.md`.
- Created the fixed report destination `docs/prompt-execution/`.
- Implemented the five-stage report contract, fixed filenames, publication command, validation rules and safety controls in the new skill.

Validation commands

Command	Result
`python C:\Users\J COMPUTER\.codex\skills\.system\skill-creator\scripts\quick_validate.py .agents/skills/stoquify-prompt-execution-roadmap-publisher`	Blocked: system Python shim could not start
Bundled Python quick validator	Blocked: `ModuleNotFoundError: No module named 'yaml'`
Validator logic with an in-memory YAML compatibility shim	Passed: `Skill is valid!`; no package or repository files were changed
`node .agents/skills/docs-report-publisher/scripts/publish_reports.mjs prompt-execution`	Passed: published 5 Markdown/PDF pairs
Destination inventory and PDF header/size checks	Passed: exact 10-file set; all PDFs non-empty and `%PDF-`
Intermediate-artifact check	Passed: no HTML, browser, temp or intermediate files

No external financial, payment, lender, insurer, production or database mutation was attempted.

Evidence and limitations

The skill file was created from the user-provided prior prompt and the repository's existing skill conventions. The formal validator command remains environment-blocked because the available Python runtimes do not have the required YAML dependency; the validator logic was separately exercised with a temporary in-memory compatibility shim and returned `Skill is valid!`. This does not replace a formal PyYAML-backed run.

Stage 8 status: Passed: 8 checks; Failed: 0; Skipped: 0; Blocked: 2 formal-validator environment checks.
